Safety Precautions

Please follow the following precautions when using Mitsubishi Electric products and be sure to carefully read the explanations regarding safety precautions in the boxes marked "Caution." In addition, ensure that any stickers or other items with relevant safety information are delivered to the final user.

1. Precautions concerning usage environment and usage conditions

- (1) Do not use in the following locations. Use in such locations may lead to malfunction or reduced service life.
 - · Locations where the ambient temperature is outside the range of -5 to +50°C.
 - \cdot Locations where the average daily temperature exceeds 35°C.
 - · Locations where condensation or relative humidity is less than 30% or more than 70% (85% for electronic indicators).
 - ☆ Moisture-proof treatment is available for high-humidity environments for some electrical indicator models. See page 10 of this catalog or contact a Mitsubishi Electric representative for details.
 - \cdot Locations with excessive dust, corrosive gas, salinity, or oil fumes.
 - * Corrosive gases include sulfur dioxide, ammonia, hydrogen sulfide and other gases that corrode metal, plastic and other materials.
 - ☆ Supplementary anti-corrosion treatment is available for special environments for some electrical indicators. See page 10 of this catalog or contact a Mitsubishi Electric representative for details.
 - · Locations where indicators are subject to excessive vibration or shock.
 - ☆ When used in a location subject to excessive vibration, moving parts may resonate and this may cause error and fluctuation of indicated values. In such cases, apply anti-vibration measures to the installed panel or change the installation location.
 - \cdot Locations directly exposed to rain, water drops, ultraviolet rays, or sunlight.
 - · Locations at an altitude of 2000m or more for electric indicators or 1000m or more for electronic indicators.
 - \cdot Locations with excessive external noise or radio waves.
 - \cdot Locations where a large amount of static electricity is generated.
 - · Locations where there is a high level of waveform distortion or high-frequency waves caused by harmonic/thyristor circuits or other means.
- (2) Please consult a Mitsubishi Electric representative regarding the use of indicators for any of the following facilities.
 - \cdot Nuclear power plants, medical devices, military facilities, airplanes or vehicles.
- (3) The products in this catalog are not certified indicators.
- They do not comply with the mandatory specifications for electrical meters as specified in the Measurement Act of Japan.

2. Mounting precautions

Please pay attention to the following items during installation.

For safety reasons, installation should only be performed by a professional electrical wiring technician.

- \cdot Mount the electrical indicators on metal panels.
- Mount on the panel in such a way that ensures the electrical indicator terminals and charged parts cannot be touched accidently by an operator.
- Install the special accessories for T-100 and T-150 inside the panel. In addition, install them so that it is ensured the accessories cannot be touched accidently by an operator.
- · The screws for mounting onto the panel must be tightened by appropriate tools at torques appropriate for the screw size.
 - * Recommended tightening torques M3 screws: 0.48~0.98N·m
 - M4 screws: 0.98~1.47N·m M5 screws: 1.47~1.96N·m

3. Connection precautions

Please pay attention to the following items when making connections.

- For safety reasons, installation should only be performed by a professional electrical wiring technician.
 - \cdot The metal panel must be grounded.
 - · Before using a voltmeter when connecting to a main power-supply circuit, make sure that an appropriate exterior fuse is installed.
 - Indicators that require an auxiliary power supply must not be directly connected to/use a main power supply. For these indicators, use a power supply that is isolated from the main power supply circuit via a voltage transformer or other means.

- Varmeters and power factor meters will not operate correctly with a reverse phase sequence. Use with the correct phase sequence.
- Grounding of the secondary side of an instrument voltage transformer or current transformer is not necessary for low-voltage circuits.

	· Connections must be made correctly as shown in the connection diagrams of the catalog. Inappropriate			
	connection and installation may cause equipment burnout, fire or leakage of electricity.			
	· For connection, use crimp terminals suited for the electrical quantity and terminal size.			
	• Make sure to use the terminal screws supplied with the product.			
	• The terminal screws must be tightened by appropriate tools at torques appropriate for the screw size.			
	Failure to do so may cause overheating, equipment burnout or fire.			
	* Recommended tightening torques M4 screws: 0.98~1.47N·m			
•	M5 screws: 1.47~1.96N·m			
	Do not perform connection work with live wires.			
CAUTION	Dangers include electrical shock, electrical burns, equipment burnout and fire.			
	· For safety, make sure to attach the terminal cover.			
	· Indicators combined with a current transformer (CT) must be correctly connected to the CT secondary-side			
	signal. Incorrect connection or opening of the secondary side of the CT will generate high voltage on the			
	secondary side of the CT, which may lead to CT failure, scorching or a fire.			
	Indicators combined with a voltage transformer (VT) must be correctly connected to the secondary side of			
	the VT. Incorrect connection or short-circuiting of the secondary side of the VT will cause a large overcurrent			
	to flow through the secondary winding of the VT, leading to scorching of the secondary winding and VT			
	failure, scorching or a fire.			

4. Precautions concerning preparation before use

Please read the following carefully before use.

(1) Transportation

Be sure to prevent the indicators from vibration or shock as much as possible during transportation.

In situations where it is possible that indicators will be subject to excessive vibration or shock, remove the indicator from the panel before transportation.

When the indicators are received, check the indicators for any abnormalities in appearance or operation that may have been caused as a result of excessive vibration or shock during transportation.

(2) Check the product name and rating

As a precautionary measure, check the product name and rating (e.g., voltage, current, frequency, phase-wire) before use.

(3) Adjustment

If an indication corresponding to an input is to be adjusted in an indicator with a built-in adjustment resistor such as a DC ammeter or receiving indicator, perform adjustment without applying excessive force to the adjuster. Otherwise, the adjuster may break.

Additionally, avoid using the adjuster under normal circumstances.

(4) Insulation resistance test and voltage test

Please read the following carefully before performing an insulation resistance test or voltage test. Not doing so may cause indicator failure.

	 When performing an insulation resistance or voltage test between 1) an electrical circuit and an outer casing, or 2) a voltage circuit and a current circuit, short-circuit the input terminals in both the current and voltage circuits. Not doing so may cause the indicator to malfunction. The applied voltage for the voltage test varies according to the indicator model. Please note the voltages indicated in this catalog. For the applied voltage of the impulse withstand test, apply a 1.2×50µs standard lightning impulse voltage waveform with a full wave voltage of 5kV six times or less. Be careful of where voltage is applied; applying voltage across terminals of equal potential, such as across VT input terminals, may cause failure.
--	--

5. Usage precautions

Please conform to the following during use.

	 (1) Use within the rated range. Use outside of the rated range may cause malfunction or failure. Applying an electric current exceeding the rated value may cause a failure. Note that this excludes certain models (AC ammeters with expanded scales), for which a temporary current (less than one minute at three times the rated value) may be applied. With the LM-11MRN, LM-11MRHN, LR-11MRN, and LR-11MRHN meter relays, when interruption of the auxiliary power supply occurs, the contact output state immediately before interruption is memorized. Thus, depending on the state during recovery from interruption, the contact output may be abnormal. After recovery from interruption, to return the indicator to normal operation, perform the resetting operation after moving the setting needle past the driving needle using the setting knob (see p.90 of this catalog for details). With the LM-11ZN and LM-11YN indicators with maximum and minimum needles, LB-8ZN, LB-11ZN, LB-11YN, LB-11ZRN, and LB-11YRN demand meters, and LB-11ZRMN demand meter relay, set the current application time of the electromagnetic remaining needle resetting terminal to "within 5 seconds." Burnout will occur if current application is continued for 5 seconds or longer. (2) If, when using a movable iron-core indicator by connecting it to the output side of an inverter, the carrier frequency of the inverter is set higher than 5kHz, the indicator may generate heat and failure may occur. Use a carrier frequency of 5kHz or less. (3) The upper-limit alarm and lower-limit alarm settings of the meter relay and demand meter relay must be set correctly. If the settings are incorrect, an alarm will not be generated when an alarm is needed. (4) A shunt (SHT) generates heat and must not be touched by bare hands as it will cause a burn. Additionally, select a well-ventilated location for installation and mount the unit giving consideration to heat radiation. (Refer to p.47 of the catalog.)
--	--

(5) Do not remove or modify the cover of an indicator, otherwise failure, electrical shock or fire may occur.

6. Precautions concerning repair/response in case of failure/abnormality

If an abnormal noise or heat is generated or a failure occurs, take immediate measures such as shutting off the input, and contact the nearest Mitsubishi Electric System & Service Co. Ltd. branch or relevant Mitsubishi Electric branch.

7. Maintenance and inspection

Perform the following inspections to ensure correct use of indicators.

- 1 Daily inspection
 - Check for the following:
 - · Damage to the indicator
 - · Abnormal functioning
 - · Abnormal noise or odor
 - · Presence of debris, dust or water
- 2 Periodic inspection
 - In addition to the above items, check for the following:
 - \cdot Loose mounting or loose terminal wire connections
 - \cdot Overheating or deformation due to stress to terminals, outer casings or other components.

Always perform terminal wire connection inspections when power to the devices has been interrupted.
Do not touch charged parts of the terminals while current is being applied. There is danger of electrical shock, electrical burns, and damage to equipment.

- (1) The cover has an antistatic treatment; please follow these precautions when cleaning it.
 - · Wipe the cover surface with a soft cloth to remove any dust/dirt. If the dust/dirt cannot be removed, the cover should be replaced.
 - To prevent cover deformation or discoloration, or peeling of the cover coating, do not use benzene, thinner or similar cleaning agents on the cover and avoid placing any type of chemically-treated cloth on the cover for a long period of time.
 - Static electricity can cause unstable needle movement. If this happens, it may be necessary to coat the cover with a commercially available antistatic agent.

8. Storage precautions

- (1) Do not store indicators for long periods in the following locations. Long-term storage in such locations may lead to malfunction or reduced service life.
 - · Locations where the ambient temperature is outside the range of -20 to +60°C.
 - · Locations where the average daily temperature exceeds 35°C.
 - · Locations where the humidity is 90%RH or more and dew condensation occurs.
 - · Locations with excessive dust, corrosive gas, salinity, or oil fumes.
 - * Corrosive gases include sulfur dioxide, ammonia, hydrogen sulfide and other gases that corrode metal, plastic and other materials.
 - · Locations with excessive vibration or shock.
 - · Locations directly exposed to rain, water drops, ultraviolet rays, or sunlight.
- (2) When storing the indicators, turn off the power, remove the wiring and place in a vinyl bag, box or other container.

9. Disposal precautions

- (1) Please note that the electric/electronic indicators do not use batteries.
- (2) Dispose of the indicators following the procedures for disposal of general industrial waste.

Warranty

- (1) The warranty period shall be one year from the date of purchase or 18 months from the date of manufacture, whichever is earlier. In addition, the repair of any failure due to a customer's intentional or negligent actions shall incur a service charge, irrespective of whether or not the warranty is still valid.
- (2) Mitsubishi Electric shall not be liable for:
 - Damage that cannot be attributed to Mitsubishi Electric; Lost opportunity or earnings resulting from failure of a Mitsubishi Electric product; Damage, secondary damage or compensation for an accident resulting from special circumstances regardless of whether or not the circumstances were foreseeable; Damage to products/Other services for products not manufactured by Mitsubishi Electric.

Service life

The expected service life of electric indicators is 10 years.

* The expected service life is the period or number of operations for which the indicator can be used without functions deteriorating to a level that impairs practical use, based on the condition that the equipment or material is used according to standard specification conditions. Please note that the expected service life is only a guide and performance is not guaranteed for this period.

(Excerpt/Summary of "Expected Service Life of Electrical Equipment," in the September, 1998 issue of the Journal of the Institute of Electrical Installation Engineers of Japan.)

1 Selection of indicator ratings

Application of an input exceeding a rating may cause failure or reduced service life.

In cases where a rating value may be exceeded temporarily due to a starting current of a motor or other reason, select an expanded scale indicator.

Meter relays respond instantaneously and thus output a signal immediately when the starting current or other current exceeds a set value.

When it is necessary to temporarily prevent detection, add an external circuit.

2 Distortion of input waveform

Error occurs readily when the input waveform is distorted.

AC ammeter/voltmeter error is comparatively low if the indicator operates using movable iron core or approximate effective value rectifications. However, please note that the internal parts of movable iron core indicators generate heat when a harmonic current is input, which may lead to deformation or scorching of the casing. For this reason, use a carrier frequency of 5kHz or less for inverter circuits.

3 Use a power factor meter for unbalanced loads if the 3-phase load is unbalanced

Power factor meter errors may occur if the load of a balanced circuit becomes unbalanced. Select a power factor meter for unbalanced loads if it is possible that the 3-phase load will be unbalanced.

4 Error may occur due to extremely low input current

Power factor meter errors may occur if the input current is significantly lower than the rated current. When selecting the rated primary current of a CT, ensure that the secondary current during actual use will be 1/5 or more of the rated secondary current of the CT.

5 Malfunction may occur due to decrease of input voltage

Wattmeters or varmeters may malfunction if the input voltage decreases. Ensure that the input voltage does not decrease to 85% or less of the indicator's rated voltage.

6 Use a special specification product in an environment with high temperature, high humidity, or corrosive gas

Insulation degradation or failure may occur when the product is used under an environment with high temperature, high humidity, or corrosive gas (e.g., in a wastewater treatment plant, sewage treatment plant, chemical plant, rubber manufacturing plant).

Please select a model with special specifications such as anti-corrosion or moisture-proof treatment.

7 Special specification products

Please specify the necessary specifications or contact a Mitsubishi Electric representative if you require a specialspecification model (see p.10). The information in the following table relates to special specifications for mechanical indicators. Please contact a Mitsubishi Electric representative for information regarding special specifications for electronic indicators.

Application	Specification			
Mounting attitude	The standard attitude for mounting indicators is vertical.			
	Please specify the mounting angle if a non-standard mounting attitude is required.

	DC ammeters, D	C voltmeters		A selection should be made so that the maximum scale value is approximately 1.2 to	1.5 times the					
	AC ammeters, A			rated value or the steady-state value of the circuit to be measured.						
	Wattmeters, var	meters	In common	For the maximum scale, any of the following values are recommended (or any of the	se values					
	Receiving indica	itors		multiplied by 10 resulting in a whole number). 1, 1.2, 1.5, 2, 2.5, 3, 4, 5, 6, 7.5, 8 (4.5 and 9 are also recommended in the case of v	oltmeters)					
					olimeters)					
	DC	C ammeters		Select a value that is 1.5 times or more than the load current. When combining with a shunt, in general, make a selection that matches the rated va	ue of the shun					
		Voltmeters		Select a value 1.2 to 1.5 times the circuit voltage.						
	DC voltmeters			The selection should have a maximum scale value approx. 1.5 times the load curren						
Scale	AC	C ammeters		When combining with a current transformer (CT), make a selection that matches the rated						
	AC	C voltmeters		Select a value 1.2 to 1.5 times the circuit voltage. When combining with a voltage transformer (VT), select a value approx. 1.36 times the rated value of th						
				Select according to the calculation result of: VT ratio × CT ratio × indicator rating (Po						
	Wa	attmeters, varme	ters	Refer to the "Scale Selection Reference Table" (wattmeter: p.56; varmeter: p.60).						
	Be	eceiving indicator	S	Select so as to match the rated value of the device that the indicator is combined with (e.g., tra	insducer sensor					
		Joonning Indicatory	<u> </u>	The standard scale is LEAD 0.5–1–LAG 0.5.						
		Power factor met	ers	A LEAD 0–1–LAG 0 scale can also be manufactured (values between 0 and 0.5 are for reference						
		Frequency mete	ers	Select according to the frequency of the circuit to be measured. In general, for 50Hz, select a 45–55Hz scale; for 60Hz, select a 55–65Hz scale and for 50						
				common use, select a 45–65Hz scale.						
		Ground voltmete		Select so that the maximum scale value is the measured circuit's voltage or 1.35 time						
		ammeters, DC vo		The indicator rating is the input value corresponding to the maximum scale value.	43~48, 79~80, 9					
	AC a	ammeters, AC vo	Itmeters		49~52, 81~82, 98					
		Wattmeters		The secondary side rated voltage of a VT is selected as the rated voltage and the secondary side rated current of a CT is selected as the rated current.	53~56, 83~84					
Indicator		Varmeters		Additionally, the rated power (or rated reactive power) Po is selected to be within a range of 0.8 to 1.2 times the secondary side rated power of the transformer (VT, CT).	57~60, 83~84					
ratings		Power factor met	ers	Generally, the secondary side rated voltage of a VT is selected as the rated voltage and the secondary side rated current of a CT is selected as the rated current.	61~65, 85					
		Frequency meter	ers	Generally, the secondary side rated voltage of a VT is selected as the indicator rating.	66, 86					
		Receiving indicat	ors		67~68, 87, 97					
	Indicate	ors with changeo	ver switch	The indicator rating is the input value corresponding to the maximum scale value.	69~70					
	Ea	arth-leakage dete	ctors		91~92					
	Synchroscopes		S	Generally, the secondary side rated voltage of a VT is selected as the indicator rating.	93~94					
Cover	Without setting needle			Black (B) needles are standard specification. Transparent (T) and special color (F) needles can also be manufactured. (Transparent cover (G) needles can only be manufactured for the Y-N and Y-2N Series						
00101	With setting nee	dle		Black (BR), transparent (GR), and special color (FR) needles are available. (Please note that not all options are available for all models.)						
Special specifications				for information regarding specifications for environments where there are special conditions ment), corrosive gases (supplementary anti-corrosion treatment) or high-frequency circuits.	10					

Note 1. The empty squares (\Box) are replaced with letters/numbers to specify the model and specifications. **Note 2.** The asterisks (*) are replaced with S or D to identify whether the indicator has one (S) or two (D) needles.

Page with specifications table 43 47 49 50 51 52	Da									- 0		-				

Remarks All indicators, excluding special grade and foreign standard specification indicators, comply with the Japanese Industrial Standards relating to direct-acting electrical indicators and have the JIS mark.

However, the JIS mark may not apply depending on the operating circuit voltage or rated voltage. Refer to the Reference Chart for Test Voltages and JIS Mark on p.25/26 for details.

Note 1. The operating circuit voltage is 300V or less for the Y-2N Series and 600V or less for the Y-N Series.

Note 2. Parentheses () indicate that some models cannot be manufactured with this rating. Refer to the specifications tables starting on p.45 for details.

Note 3. Some models cannot be manufactured for some ratings. Refer to the specifications tables starting on p.45 for details.

Note 4. Please designate the frequency if a special accuracy class is required for an AC indicator.

_	Page with specifications table 43				3	4	7	4	9	5	0	5	1	5	2			

Remarks All indicators, excluding special grade and foreign standard specification indicators, comply with the Japanese Industrial Standards relating to direct-acting electrical indicators and have a JIS mark.

However, the JIS mark may not apply depending on the operating circuit voltage or rated voltage. Refer to the Reference Chart for Test Voltages and JIS Mark on p.25/26 for details.

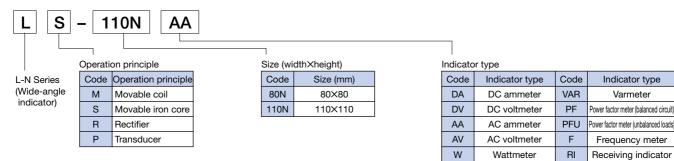

Note 1. The operating circuit voltage is 600V or less.

Note 2. Some models cannot be manufactured for some ratings. Refer to the specifications tables starting on p.45 for details.

Note 3. Models with an indicator rating of 600V are provided with the KR-1 accessory.

Note 4. Please specify the frequency if a special accuracy class is required for an AC indicator.

Remarks All indicators, excluding special grade and foreign standard specification indicators, comply with the Japanese Industrial Standards relating to direct-acting electrical indicators and have a JIS mark.

Note 1. The 3-terminal, CT-combined models of YR-8UNAA and YR-10UNAA operate on the principles of the movable iron core.

Note 2. The operating circuit voltage is 600V or less.

Note 3. A 4-terminal AC ammeter to be combined with a transformer can be manufactured if required.

Remarks All indicators, excluding special grade and foreign-standard specification indicators, comply with the Japanese Industrial Standards relating to direct-acting electrical indicators and have the JIS mark.

Note 1. The operating circuit voltage is 300V or less.

Note 2. Parentheses around an indicator rating indicate that the rating is only available for certain models. Refer to the specifications for details.

Model Naming System

Glossary of Terms

Term	Meaning	Term	Meaning
Electric indicator (direct-acting indicator)	An indicator with a needle driven by a mechanically coupled movable element.	Intrinsic error	Error of an indicator in a standard state. Intrinsic error = $\left(\frac{\text{target value - reference value}}{\text{base value}}\right) \times 100 (\%)$
Electronic indicator	An indicator that uses an electronic means to measure and display an electrical quantity or non-electrical quantity.		A specified standard-error value used to define the accuracy of an indicator. The value varies according to the type of
Fixed indicator (indicator for switchboard)	Indicators that are mounted permanently, connected to an external circuit via fixed conductive wires.		 indicator. For ammeters, voltmeters, wattmeters and varmeters, the standard value is the upper value of the measurement range.
Portable indicator	An indicator that can be transported and used in different places.		(If there are both mechanical and electrical zero points in the scale [i.e., there is a negative and positive range], the
Wide-angle indicator	An indicator with a scale spanning a range of 180° or more.	Standard value	standard value is the sum of the absolute values of the
Receiving indicator	Indicators with scales that differ from the quantity of electricity input, but the relationship between the quantity of electricity input and scale values is known.		electrical quantity corresponding to the two limits of the measurement range.) (If the scale does not match the quantity of the electricity input, the standard value is the span.)
Zero-suppressed	An indicator with a mechanical zero point outside the range		Frequency meter
indicator	of the scale.		The upper value of the measurement range.
	An indicator that operates based on the interaction between		Power factor meter
Movable coil	magnetic fields produced by a fixed, permanent magnet and		Electrical angle of 90°.
indicator	by a current inside a movable coil.		The algebraic difference between the upper and lower limits
	Indicators that have fixed and moving cores made of soft	Span	of the measurement range.
Movable iron core indicator	magnetic material and operate based on the repulsive force (and suction) generated as a result of magnetizing the fixed and mobile iron cores by passing an electrical current	Overshoot	The difference between the maximum deflection value and the final value when a measured quantity changes suddenly.
	through the fixed coil.		
Rectifier indicator	An indicator combining a DC-operated indicator and a rectifier to measure AC current/voltage.	Response time	When the measurement value changes suddenly from zero to a specified value, the time (seconds) until the needle stops at its final stationary position.
Transducer indicator	An indicator that converts a quantity of AC electricity to a DC voltage/current using an electronic device or circuit, and then indicates the quantity using a movable coil indicator.	Residual displacement	The deflection of a mechanically controlled movable element still remaining after the cause of the deflection has been eliminated.
Bimetal indicator	Heat-based indicators that operate by changing the shape of the metal elements, which occurs when they are heated directly/indirectly via an electrical current.	Extent of influence	In general, the potential extent of influence that an external factor has on performance (e.g., ambient temperature, external magnetic field).
Compatible accessory	An accessory that has special properties/accuracy itself, regardless of whether or not it is combined with the performance of an indicator.	Distortion rate (total harmonic distortion rate)	Rate: Effective value of the harmonics contained Effective value of non-sinusoidal wave
Limited-compatibility accessory	An accessory that has special properties/accuracy itself and can be combined with an indicator that has special performance.	Ripple content	Content: Effective value of varying component value of DC component
Dedicated accessory (non-compatible accessory)	An accessory that is adjusted considering the electrical characteristics of the indicator it is combined with.	Standby state	Prior to indicator testing, the specified measurement amount supplied to the circuit being measured.

•Abbreviations for items measured Standard value DA : DC current 1) DA, DV, AA, AV, W, VAR DV : DC voltage The upper limit of the AA : AC current measurement range; the sum of AV : AC voltage the absolute values of both sides W : Power where there is a zero point on the scale [i.e., there are positive and VAR : Reactive power PF : Power factor, phase negative ranges]; the span when F : Frequency the scale does not match the SY : Synchroscope quantity of electricity. 2) F Upper-limit value of the measurement range

3) PF, SY 90° electric angle

Standby conditions

Prior to testing, the following input is applied to meters that are required to have a standby state.

Measured quantity	Input condition	Time
DA, DV, AA, AV	80% of maximum scale value	
W, VAR	Voltage: 100%; power factor (or reactive factor): 1 80% of maximum scale value	15
F	Voltage: 100%; maximum scale value	minutes
PF	Voltage: 100%; current: 80%; power factor: 1	
SY	Voltage: 100%; synchronization point

Note 1. The factory-tested voltages are the values for the voltage test at the time of shipment. (The test may be performed at a value higher than the standard value.) **Note 2.** Values in JIS C 1102-1 to 7 (1997 version). **Note 3.** In some cases, special specification models (special grade, foreign standards) may not have a JIS mark.

Note 4. Models shown in shaded areas do not have the JIS mark.

Mechanical Indicators

Common Specifications

Common standard specifications

Standards	Direct-acting electrical indicators JIS C 1102-2, JIS C 1102-3, JIS C 1102-4, JIS C 1102-5, JIS C 1102-7
Accuracy (grade)	Class 1.5 or 2.5 (frequency meters: class 0.5 or 1; power factor meters: class 5, synchroscope: class 5)
Usage temperature range	-5°C to 50°C (reference temperature: 23°C)
Usage humidity range	At a relative humidity of 30% to 70%, there are no adverse effects on indications.
Mounting attitude	Vertical (the scale plate is vertical with respect to a horizontal surface)
Scale plate	Background color: white
Cover	Acrylic resin (with antistatic treatment applied)
Case	Steel plate or molded product
Input signal peak-to-rms ratio	Sine wave $(\sqrt{2})$
Measurement category	CAT III (category of measurement performed inside a building facility)
Operating environment	2 (non-conductive pollution only)
pollution rating	
Installation altitude	2,000m or less
Usage location	Indoors
Mounting panel	Metal panel
Voltage test	Rated voltage 300V: 2210V for 5s; rated voltage 600V: 3320V for 5sNote 1 (between electrical circuit and outer casing)
Insulation test	$10M\Omega$ or more at a test voltage of 500V (between electrical circuit and outer casing)
Storage temperature	-20°C to 60°C

Note 1. Refer to the Reference Chart for Test Voltages and JIS Mark on p.25/26 for information regarding the circuit voltage ranges of respective models and applicable voltage test values.

Remarks The B design cover is standard specification. The G and F design covers and covers with red needles can be manufactured if required.

Note 1. When ordering the F-design cover, please use F as the cover code and specify the color coating. Munsell 7.5BG 4/1.5 will be used for orders with no color coating specified.

Cover codes

Cover specifications	Without red needle	With red needle
B design	В	BR*1
G design	G	GR
F design	F	FR

Remarks For the Y-N Series, a B cover with two red needles (BRR cover) can be manufactured depending on the model (please inquire for details).

Accessories

Nuts for mounting screws are provided with all models. T-150 and other special accessories are indicated in the specification columns of the respective indicator types.

Scale plate indications

The following tables show the scales, including numerals, colored lines, bands and colors, used as standard specifications. Red, blue, green and yellow are used for the colored lines/bands.

Remarks (1) See the "Standard Scale Diagrams" on pp.31 to 34 regarding the scale division with respect to the maximum scale value. (2) Special scales can also be manufactured.

1a. Y-206N ordinary scale indicators

1b. Y-206N expanded scale indicators

Remarks (1) In the case of a bidirectional deflection indicator, determine the specifications according to the following.

wire thickness and one-way length or round-trip resistance.

- Direct-rating models can be manufactured if the larger of the left and right scales is 30A or less.
- For combined use with a shunt, select a scale so that the sum of the absolute values of the indicator ratings is 60mV or more.

Example: In the case of a shunt with ratings of 100A and 60mV Ammeter scale -50~0~+100A Ammeter rating -30~0~+60mV

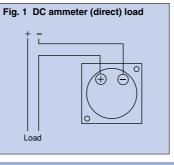

- (Sum of absolute values=90mV≥60mV)
- (2) Refer to "Receiving Indicators" on p.67 concerning zerosuppressed indicators.
- (3) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

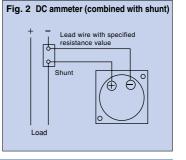

Ordering method

The items in _____ must be specified.

Indicator combined with shunt	Shunt rating +	Thickness and length of lead	Number of
Model name Indicator rating Scale	Cover type required/not required	wire + required/not-required Special specifications	units
YM-206NDA 60mV 0-200A	B SHT 200A 60mV, required	lead wire 3.5mm ² 3m, not required Double scale, colored lines, etc.	10
		With lead wire adjustment	
Direct indicators		resistor	
		VR VR	Number of
Model name Scale Cover type			units
YM-206NDA 0-20A B	Double scale, colored lines, etc.		10

Connection diagrams

DC ammeter combined with shunt

For DC ammeters combined with a shunt, the measured value changes according to the resistance value of the lead wire. Thus, please refer to the following tables and specify the thickness and one-way length or round-trip resistance value of the lead wire connecting the indicator and the shunt.

The lead wire resistance value must be within the "maximum allowable value."

•Table of maximum allowable values of lead wires for DC ammeters combined with shunts

	DC ammeter combined with shun	Maximum one-way length (m) in the case of a 2mm ² lead wire (Mitsubishi	Maximum one-way length (m) in the	
Model name	Indicator rating (mV)	Maximum allowable resistance value of lead wire (Ω)	Electric standard lead wire)	case of a 3.5mm ² lead wire

Remarks (1) In the case of a bidirectional deflection indicator, the indicator rating is the sum of the absolute values of the respective ratings.
(2) If a lead wire length exceeding the values in the above table is required, use a lead wire with a large cross-sectional area or use a shunt with a high rated voltage.

• Table of round-trip resistance values according to lead wire thicknesses and one-way lengths

Lead wires for shunt connection

Lead wires for connecting an indicator with a shunt can be manufactured according to specifications as accessories to the indicator.

The standard is: two 2mm² - 2m (one-way) 1500V heat-resistant vinyl wires (blue) for electric equipment.

Remarks (1) Only wires with a cross-sectional area of 2mm² are provided; other types of wires are to be prepared by the customer.

DC ammeter with lead wire adjustment resistor

If a DC ammeter combined with a shunt is to be arranged in advance with the lead wire length being indeterminate, use a DC ammeter with a lead wire adjustment resistor, which can be adjusted according to the lead wire resistance after installation of the indicator.

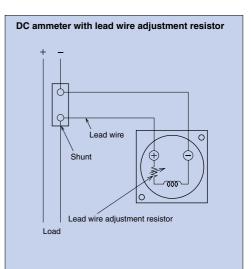

Adjustment range of lead wire resistance

The lead wire resistance adjustment range is the same as the maximum allowable resistance value of lead wire in the "Table of maximum allowable values of lead wires."

Adjustment method

Adjustment by voltage application

Disconnect the lead wires connected to the voltage terminals of the shunt, and adjust with the lead wire adjustment resistor so that the indicator deflects fully when a voltage corresponding to the indicator rating is applied to the respective ends of the lead wires.

Accessories

Shunt for DC ammeter

Specifications

Accuracy	Grade 0.5 Percentage with respect to the rated voltage drop between voltage terminals or the shunt resistance value when the consumption current of the indicator is ignored.
Rated voltage	60mV (standard), 100mV (quasi-standard)
Rated current	1~7500A
Structure	Shunt with base for 150A or less, shunt without base for 200A or more.
Voltage test	3320VAC for 5s (applies only to shunts with base)
Insulation resistance	10M Ω or more at test voltage of 500V (applies only to shunts with base)

Remarks (1) For low-current shunts, the influence of the consumption current may be significant in some cases. If a shunt is ordered separately, it may be necessary to adjust the indicator that is used in combination with it.

(2) Shunts are designed for a temperature rise limit of 80°C at a current that is 80% of the rated current. For this reason, adequate care is required when tightening the bus lines in high-current, large-loss applications.

(3) Shunts with an insulating base can also be manufactured for rated currents greater than 150A and 600A or less.

Rating selection and mounting

1. Rating selection

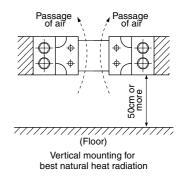

For the shunt rating, select a current value with adequate allowance, taking into consideration that a shunt is a heat source. (As a general rule, use a shunt for values approximately 1.5 times or more of the continuous operating current.)

2. Mounting attitude

Mount the shunt as shown in the diagram.

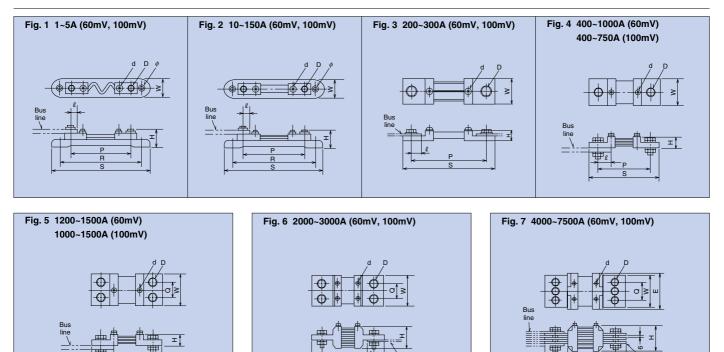

3. Voltage terminals

Two voltage terminals are provided at one side block for shunts with a voltage of 2000A or more. In this case, use the diagonally positioned voltage terminal. (Error may increase by approximately 0.5% when the voltage terminals are used in parallel.)

Number of sheets at ourrent terminal: 3

Remarks (1) If, with a maximum scale of 600V or less, an externally mounted multiplier is desired, the voltmeter Delivery period classification will be manufactured with the GR-2 multiplier as an accessory.

(2) Indicators with both positive and negative readings on the scale can be manufactured if the larger of the left and right scales is 2000V or less.

Symbol	©Standard	○Quasi-standard	∆Special
Gymbol	product	product	product
Reference delivery period	Immediate delivery	Within 20 days	21 to 60 days

The table above shows whether or not a multiplier is provided.

(3) If a high sensitivity (high input resistance) indicator is desired as a DC voltmeter with a maximum scale of 100V or less, please specify the maximum scale and sensitivity current of the indicator.

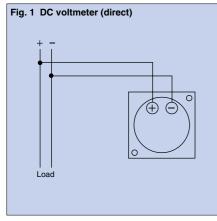

Voltmeters can be manufactured with a sensitivity current within the range shown for DC ammeters on p.45.

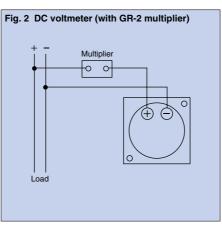

There may be a maximum difference of approximately ±5% with respect to the value specified for the sensitivity current.

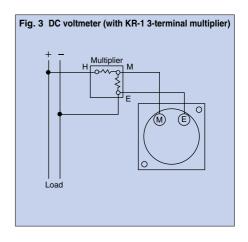

- (4) The GR-2 and KR-1 multipliers are dedicated accessories (non-compatible). They can only be used in combination with the indicators specified.
- (5) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Note 1. These voltmeters do not have a JIS mark.

Connection diagrams

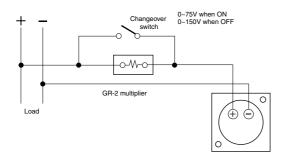

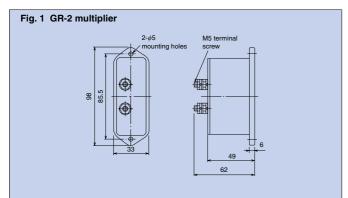

Dual-range indicators

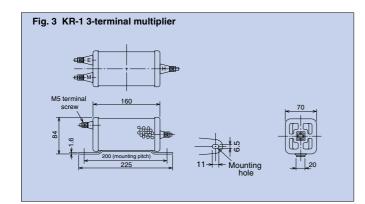

Dual-range indicators with a maximum scale of 600V or less are manufactured with the GR-2 multiplier as an accessory.

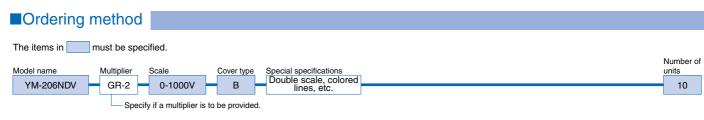

[Example] In the case of a dual-range indicator with 0~150V and 0~75V indicator scales.

Expanded scale indicator

Use expanded scale indicators in motor circuits or other locations where overcurrents flow temporarily.

The effective measurement range is up to the indicator rating value (1x value). The expanded scale part is for reference only, and the scale numerals are indicated in red.

Remarks Ensure that a current exceeding the rating is applied such that (the applied current (A)/rated current (A))²Xapplication duration does not exceed 500.

Remarks (1) Error may occur due to waveform distortion.

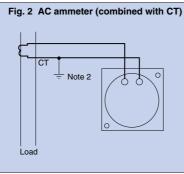

(2) LR-110NAA and LR-80NAA models rated 100mA to 30A incorporate an approximate effective value rectifying circuit.

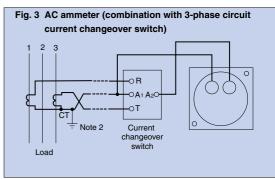

(3) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to

assist in selecting the model and use specifications suited to the application. Note 1. The operating circuit voltage is 300V or less for the Y-2N Series, and 600V or less for the Y-N Series and L-N Series.

Remarks (1) A specially rated AC voltmeter with a rectifier indicator and a maximum scale of 600V or less is manufactured. (2) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

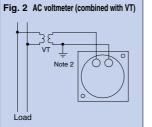

Note 1. The LS-110NAV and LS-NAV direct 600V indicators are provided with the KR-1 multiplier as an accessory (power consumption is approximately 6VA). The KR-1 multiplier is a dedicated accessory (non-compatible accessory), and thus cannot be used in combinations other than those designated for the indicators.

Remarks (1) Although the scale of the rectifier AC voltmeter is substantially uniform with an indicator having a Delivery period classification maximum scale value of 10V or less, the divisions are slightly reduced near "0".

(2) Error may occur due to waveform distortion.

(3) LR-110NAV and LR-80NAV models rated 75V to 300V incorporate an approximate effective value rectifying circuit.

(4) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Note 1. These models do not have a JIS mark.

Remarks (1) In regards to "Indicator rating (Po) kW" in the "Rating" column:

1-phase, 2-wire [Po=110V×5A=550 ~ 0.5kW wattmeters $Po=220V\times 5A=1100\,{\simeq}\,1.0kW$ 3-phase, 3-wire $\int P_0 = \sqrt{3} \times 110V \times 5A = 953 \simeq 1 kW$ wattmeters l Po=√3×220V×5A=1906≃2kW

(Po=0.4 to 0.6kW, taking into account adjustment range multiplying factors of 0.8 to 1.2) (Po=0.8 to 1.2kW, taking into account adjustment range multiplying factors of 0.8 to 1.2) (Po=0.8 to 1.2kW, taking into account adjustment range multiplying factors of 0.8 to 1.2) (Po=1.6 to 2.4kW, taking into account adjustment range multiplying factors of 0.8 to 1.2)

(Po=0.8 to 1.2kW, taking into account adjustment range multiplying factors of 0.8 to 1.2)

3-phase, 4-wire wattmeters

 $Po=3\times \frac{110}{\sqrt{3}}V\times 5A=\sqrt{3}\times 110V\times 5A=953\simeq 1kW$

Po=3×110V×5A= $\sqrt{3}$ ×190V×5A=1650 \simeq 1.7kW (Po=1.4 to 2.0kW, taking into account adjustment range multiplying factors of 0.8 to 1.2)

Po=3×220V×5A= $\sqrt{3}$ ×380V×5A=3300 \simeq 3.4kW (Po=2.8 to 4.0kW, taking into account adjustment range multiplying factors of 0.8 to 1.2)

(2) Bidirectional deflection indicators can also be manufactured.

(3) Models with a 1A current rating can also be manufactured; the power consumption is basically the same as that of a 5A model.

The indicator rating value in this case is calculated by substituting 1A in place of 5A in the equations of Remarks (1).

(4) The T-150 rectifier is a dedicated accessory (non-compatible accessory), and thus cannot be used in combinations other than those designated for the indicators. The distance between the indicator and the T-150 rectifier must be 5m or less, or the round-trip lead wire resistance must be 0.5Ω or less. (5) The weight of the T-150 accessory rectifier is approximately 1kg.

(6) Use a wattmeter with an input voltage in the range of 85 to 115% of the rated value (rated voltage ±15%).

The indication may be unstable when used with an input voltage of 85% or less of the rating or the input voltage is switched on and off.

(7) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Scale calculation formula for wattmeter

Phase-wire system	Secondary rating	Scale calculation formula for wattmeter	Remarks
1 phase 0 wire	110V 5A	Indicator scale P (kW)=VT ratio \times CT ratio \times Po (0.4~0.6)	The value at the left is
1-phase 2-wire	220V 5A	Indicator scale P (kW)=CT ratio × Po (0.8~1.2)	multiplied by 1/5 in the case of
1-phase 3-wire	100/200V 5A	Indicator scale P (kW)=CT ratio × Po (0.8~1.2)	a CT secondary current of 1A.
Q phase Q wite	110V 5A	Indicator scale P (kW)=VT ratio × CT ratio × Po (0.8~1.2)	
3-phase 3-wire	220V 5A	Indicator scale P (kW)=CT ratio × Po (1.6~2.4)	
	<u>110</u> /110V 5A	Indicator scale P (kW)=VT ratio \times CT ratio \times Po (0.8~1.2)	
3-phase 4-wire	110/190V 5A	Indicator scale P (kW)=VT ratio × CT ratio × Po (1.4~2.0)	
	220/380V 5A	Indicator scale P (kW)=VT ratio × CT ratio × Po (2.8~4.0)	

Calculation example: In the case of a 3-phase, 3-wire circuit, VT 6600/110V and CT 100/5A

Indicator scale P (kW)=
$$\frac{6600}{110} \times \frac{100}{5} \times Po (0.8 \sim 1.2) = 960 \sim 1440 kW$$

Therefore, wattmeters can be manufactured with a scale of 960-1440kW.

This varies slightly according to the rating. Refer to the Wattmeter Scale Selection Reference Table on p.58 for details.

Wattmeter Scale Selection Reference Table

Although the maximum scale of a wattmeter can be determined by VT ratio X CT ratio X indicator rating (Po), the following table shows the manufacturable scale values (minimum, standard and maximum) for various VT ratios and CT ratios. If a scale value other than the standard value is desired, please specify a suitable scale within the manufacturable range.

Table	of manu	factura	able m	aximu	m scale	es for	wattme	eters			: Scale unit	s kW 📃	: Scale	units MW

Remarks (1) The varmeters are bidirectional deflection indicators. Unidirectional deflection indicators can be manufactured upon request.

(2) In regards to "Indicator rating (Po) kvar" in the "Rating" column:

3-phase, 3-wire $\begin{cases} Po=\sqrt{3}\times110V\times5A=953\simeq1kvar \\ Po=\sqrt{3}\times220V\times5A=1906\simeq2kvar \\ Po=3\times\frac{110}{\sqrt{3}}V\times5A=\sqrt{3}\times110V\times5A=953\simeq1kvar \\ Po=3\times110V\times5A=\sqrt{3}\times110V\times5A=953\simeq1kvar \\ Po=3\times110V\times5A=\sqrt{3}\times110V\times5A=1650\simeq1.7kvar \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=3\times110V\times5A=\sqrt{3}\times190V\times5A=1650\simeq1.7kvar \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=3\times110V\times5A=\sqrt{3}\times190V\times5A=1650\simeq1.7kvar \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=3\times110V\times5A=\sqrt{3}\times190V\times5A=1650\simeq1.7kvar \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2) \\ Po=1.4 to 2.0kvar, taking into account adjustment range multiplying factors of 0.8 to 1.2 to 2.0kvar, taking into account adjustment range$

- (3) Regarding the maximum scale of a varmeter
- With a bidirectional deflection indicator, the left side is LEAD and the right side is LAG with respect to "zero" as the central division, and the standard scale indicates up to 1/2 of the maximum scale value. A scale indicating up to the maximum scale value can also be manufactured.
- With a unidirectional deflection indicator (with "zero" at the left end), the scale indicates up to the maximum scale value. Please specify LEAD or LAG; the standard is LAG.
- (4) Models with a 1A current rating; can also be manufactured; the power consumption is basically the same as that of a 5A model.
- (5) The T-150 rectifier is a dedicated accessory (non-compatible accessory), and thus cannot be used in combinations other than those designated for the indicators. The distance between the indicator and the T-150 rectifier must be 5m or less, or the round-trip lead wire resistance must be 0.5Ω or less.
 (6) Use a varmeter with an input voltage in the range of 85 to 115% of the rated value (rated voltage ±15%).
- The indication may be unstable when used with an input voltage of 85% or less of the rating or the input voltage is switched on and off.
- (7) The weight of the T-150 rectifier is approximately 1kg.
- (8) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Scale calculation formula for varmeter

Phase-wire system	Secondary rating	Scale calculation formula for varmeter	Remarks
3-phase 3-wire	110V 5A	Indicator scale P (kvar)=VT ratio \times CT ratio \times Po (0.8~1.2) \times 1/2	●The value at the left is
5-phase 5-wire	220V 5A	Indicator scale P (kvar)=CT ratio \times Po (1.6~2.4) \times 1/2	multiplied by 1/5 in the case of
3-phase 4-wire	<u>110</u> √3/110V 5A	Indicator scale P (kvar)=VT ratio \times CT ratio \times Po (0.8~1.2) \times 1/2	a CT secondary current of 1A.
5-phase 4-wire	110/190V 5A	Indicator scale P (kvar)=VT ratio \times CT ratio \times Po (1.4~2.0) \times 1/2	

Calculation example: In the case of a 3-phase, 3-wire circuit, VT 6600/110V and CT 100/5A, and a bidirectional deflection indicator with a scale indicating up to 1/2 the maximum scale value.

Indicator scale P (kvar)= $\frac{6600}{110} \times \frac{100}{5} \times Po (0.8 - 1.2) \times 1/2 = 480 - 720 kvar$

The manufacturable range of the varmeter scale is thus LEAD (480 to 720) ~ 0 ~ LAG (480 to 720) kvar.

The manufacturable range differs slightly according to the rating. For details, refer to the "Varmeter Scale Selection Reference Table" (p.60).

Note 1. For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

■Varmeter Scale Selection Reference Table

Although the maximum scale of a varmeter can be determined by VT ratio \times CT ratio \times indicator rating (Po), the following table shows the manufacturable scale values (minimum, standard and maximum) for various VT and CT ratios. If a scale value other than the standard scale value is desired, specify a suitable scale within the manufacturable range.

							-									

Remarks (1) The standard indicator rating (Po) is 1kvar.

(2) For CT ratio scales not shown in the above table, multiply the ten-fold CT ratio scale values by 0.1 and the 1/10 CT ratio scale values by 10.

Note 1. Some of the maximum scale values in the table deviate from the VT ratio × CT ratio × adjustment range multiplying factor. This is because the best values are selected, and the values in the table are given priority.

Remarks (1) Indicators with a LEAD 0-1-0 LAG scale can also be manufactured; however, measured values for **Delivery period classification** power factors of 0.5 or less are for reference only

- (2) Use with an input current of 1/5 (e.g. 1A) or more of the rated current (e.g. 5A). The error increases as the input current decreases. (3) In a power OFF or no-load state, the pointer of the power factor meter stops at the mechanical zero
- point; black point near the power factor of 1.
- (4) The T-100 rectifier is a dedicated accessory (non-compatible accessory), and thus cannot be used in combinations other than those designated for the indicators.

Models with a current rating of 1A can also manufactured; the power consumption is basically the same as that of a 5A model.

- (6) Four-quadrant power factor meters can also be manufactured for LI-1NPF 3-phase, 3-wire balanced circuits. Please contact a Mitsubishi Electric representative for details.
- The weight of the T-100 rectifier is approximately 0.9kg.
- (8)
- Cannot use with unbalanced loads. Please specify the frequency in the case of the power factor meter for 1-phase, 2-wire systems. (9)(10) Use with a positive phase sequence.
- (11) In the case of a negative phase sequence input with a 3-phase, 3-wire circuit, LEAD and LAG are indicated in an inverted manner. Indicators return to normal operation when the connections of the P2 and P3 circuits of the voltage input terminals are interchanged.
- (12) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Pag	e with outer dime	nsions drawing								35	5											3	6				

Remarks (1) A LEAD 0~1~0 LAG scale can also be manufactured; however, the measured power factor values of 0.5 or less are for reference only.

(2) Please specify the frequency.

(3) Use with an input current of 1/5 (e.g. 1A) or more of the rated current (e.g. 5A). The error increases as the input current decreases.

(4) In the power off or no-load state, the needle of the power factor meter stops at the mechanical zero point; black point near the power factor of 1.

(5) The T-150 rectifier is a dedicated accessory (non-compatible accessory), and thus cannot be used in combinations other than those designated for the indicators. The distance between the indicator and the T-150 rectifier must be 5m or less, or the round-trip lead wire resistance must be 0.5Ω or less.

(6) Models with a current rating of 1A can also manufactured; the power consumption is basically the same as that of a 5A model.

(7) The weight of the T-150 rectifier is approximately 1.4kg.

(8) Can also be used for balanced circuits.

(9) Use with a positive phase sequence.

For the following models, indicators will not be function normally when a negative-phase sequence is input. Return the indicators to normal operation by interchanging the voltage and current circuits.

Model name	Indication state	Reset indicator for normal operation
YP-206NPFU, YP-208NPFU YP-210NPFU YP-8NPFU, YP-10NPFU LP-80NPFU	The indicator reading is unclear.	Change the voltage and current circuit connections as follows: • Switch P1 and P3 • Switch +C1 and +C3 • Switch C1 and C3

(10) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Receiving indicators indicate the quantity measured when an electrical signal is received from the transmitter of a detector of a power/instrumentation transducer. Receiving indicators are used to measure industrial quantities, including remote measurements.

- Measurement of pressure, temperature, speed, rpm and other industrial quantities
- •Telemetry measurement (remote measurement) in combination with transducers

Refer to p.151 onward of this catalog regarding the transducers to be used with receiving indicators.

Note 1. A 500 niternal resistance indicator can also be manufactured for models with indicator ratings of 1mA **Delivery period classification** and ±0.5mA Symbol

Please specify an internal resistance of 500Ω.

Note 2. In the case of scales with units of electricity (A, V, W, var, cosø, Hz), AC/DC and three-phase circuit symbols are not displayed. For receiving indicators, the symbol for the quantity input is displayed.

Remarks (1) With a zero-suppressed indicator, the zero point of the needle is suppressed mechanically to eliminate the zero point.

- Zero-suppressed indicators can be manufactured for values of 20% or lower of the maximum rating of the indicator.
- (2) For cases when the indicator input is DC voltage, an indicator with an adjustment resistor, where the adjustment resistor is added internally to the indicator, can be manufactured. (This type can be used in combination with specific scales.)
 - The range of adjustment by the adjustment resistor is ±5% to ±20% with respect to the maximum scale value.
 - The adjustment resistor is mounted on the rear face (i.e., face with terminals) of the indicator.
- (3) rpm detectors and other industrial quantity detectors are to be prepared by the customer.

(4) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Indicator rating and delivery period classification	Combined with CT	3-terminal Note 2	/5A (indicator rating: 5A) /1A (indicator rating: 1A)	1.5	0	0	0	0	0	0		

Note 1. With YR-8UNAA and 10UNAA, the 3-terminal-combined-with-CT model is of the movable iron core type.
 Note 2. The 4-terminal configuration can be manufactured for models combined with CT. Please designate as "4-terminal." However, the operation principle will be the rectifying type.

Remarks (1) A switch nameplate for 1-phase, 3-wire systems can be manufactured. Please specify "with 1-3 nameplate."

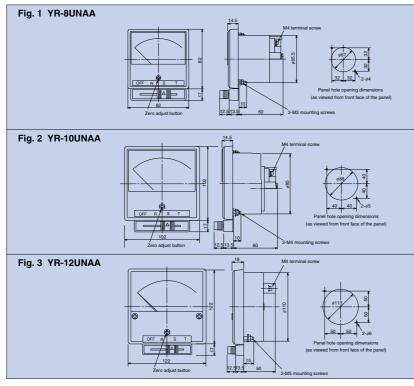

Delivery period classification									
Symbol	©Standard	OQuasi-standard	∆Special

Mechanical Demand meter and demand meter relay usage precautions

- (1) Precautions concerning overload As malfunctions may occur when an overload input is applied continuously, select a rating that does not cause the demand meter indicator to exceed the scale.
- (2) Instantaneous meters do not have a zero adjuster (when combined with an indicator). In addition, demand meter relays do not have a zero adjuster for either demand meters (driving needle) or instantaneous meters.
- (3) Although the demand-meter-relay alarm setting needle (yellow) follows the driving needle (black), when the driving needle exceeds the preset alarm value, the alarm setting needle returns to the original state (setting value) when the driving needle returns to the alarm setting value or less.
- (4) The demand-meter-relay contact output turns off regardless of the state when the auxiliary power supply is interrupted and returns to normal operation immediately after power is restored.

(5) When transporting a demand meter relay, make sure to move the setting needle (yellow) to 70% or more of the maximum scale value.

(The contact adjustment value may change or a malfunction may occur due to vibration or shock during transport if the needle is close to the zero point.)

- (6) When the ambient temperature changes suddenly, the zero point of the demand meter may change (1 to 2mm) temporarily. However, this will return to normal after a few hours.
- (7) To reset electromagnetic marker needles, use a switch that "opens" when released. In addition, set the duration of electricity supply to the reset terminal to within five seconds. The maximum/minimum value marker needles can be moved to the position of the driving needle manually or by resetting the electromagnetic marker needle.

AC ammeters/AC voltmeters

- •AC ammeters Time intervals: 2, 5, 10 and 15 minutes (LB-8ZNAA: 2 and 15 minutes)
- •The demand current and instantaneous current can be measured and maximum demand current can be recorded. AC ammeters can also be used for load monitoring; for example, monitoring the load of voltage transformers or feeders.

●AC voltmeters Time interval: 2 minutes

•The average and instantaneous voltages can be measured, and maximum and minimum voltages can be recorded. AC voltmeters can also be used to monitor voltage fluctuation in low-voltage bus lines and high-voltage circuits.

Remarks (1) Refer to the "Wattmeter Scale Selection Reference Table" (p.56) regarding the manufacturable maximum scale value of a wattmeter.

(2) The T-150 rectifier and T-150LB DC amplifier are dedicated accessories (non-compatible). They can only be used in combination with the indicators specified. The distance between the indicator and the T-150LB DC amplifier/T-150 rectifier must be 5m or less, or the round trip lead wire resistance must be 0.5Ω or less.

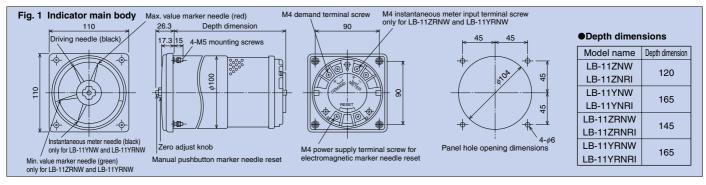

(3) Wattmeters cannot be manufactured with both positive and negative readings on the scale.

For receiving indicators with a positive/negative scale, use a transducer to convert positive/negative input to positive output (e.g., convert input of -1,000 to 0 to +1,000W to output of 0 to 0.5 to 1mA).

(4) For scales that measure in electrical units (A, V, W, var, cosø, Hz), AC/DC and three-phase circuit symbols are not displayed. For receiving indicators, the symbol for the quantity to be input is displayed.

(5) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Note 1. Connect if an electromagnetic marker needle reset circuit is to be provided. Additionally, use a switch that "opens" when released. **Note 2.** For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

Connection examples of receiving indicators

Note 1. Connect when an electromagnetic reset circuit is installed. Additionally, use a switch that opens when disconnected. **Note 2.** For low-voltage circuits, secondary-side connections of current transformers/meter transformers are not required.

Mechanical Indicators

AC ammeters

Time intervals: 10 and 15 minutes; the 10-minute model complies with the Fundamental Specifications for Electrical Construction of the Ministry of Land, Infrastructure, Transport and Tourism of Japan.

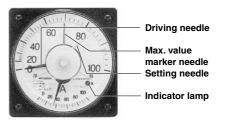

- These indicators are used to measure electricity demand and have a marker needle that displays the maximum value measured, which is used to output an alarm signal.
- AC ammeters can be used to measure electricity demand such as at electric power substations.
 Provided with relay operation indication (LED).

Time interval and indications of demand meters

The time interval (to) of a demand meter refers to the time required for an indicated value (lo) to indicate 95% of a fixed input (I) when the input (I) is supplied continuously.
 Additionally, for 100% of the input (I) to be indicated, a time of approximately 3 times the time interval (to) is required.

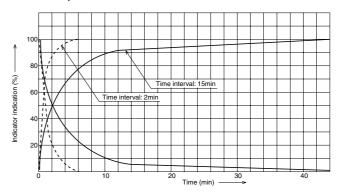

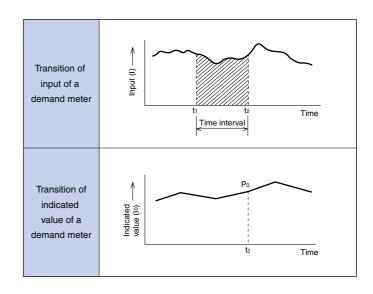

Indicated value of demand meters

- •As described above, demand meters operate over a comparatively long time, and unlike ordinary indicators, they are not directly influenced by factors such as short-time input fluctuations and flicker. Demand meters basically indicate the average value (of demand) for load fluctuation within the time interval.
- •The maximum and minimum value marker needles record the maximum and or minimum values indicated by the driving needle, enabling the past maximum demand values to be obtained.

- •For mechanical demand meters or demand meter relays, a coiled bimetal is heated by the input current and the thermal change of the bimetal is used for the indication (bimetal). The indicated value is the effective value of the input.
- •For electronic demand meters or demand meter relays, the same characteristics are realized via computation using a microcomputer.

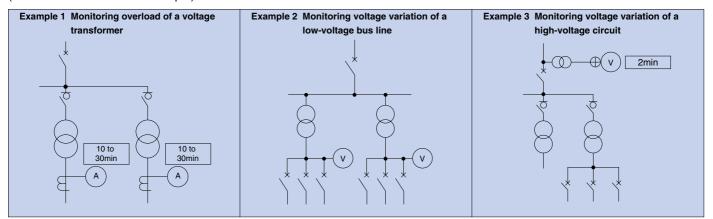

Selecting the time interval of demand meters

•The time interval of a demand meter is selected according to the facility equipment to be monitored and the purpose of monitoring.

(Demand meter selection example)

Meter Relays

Meter relays enable alarms to be issued and automatic control based on contact outputs at the same time as measurement of voltage, current and other items.

YR-210MRNAA

LR-11MRNAA

Sustained-output models covering the entire scale

Sustained-output needle-pass relays are incorporated, enabling output over the entire scale range to be covered.

100/200VAC switching auxiliary power supply

Can be used with either 100-110VAC or 200-220VAC.

Equipped with relay operation indication lamp

The operating state of the relay can be seen, even from a distance.

Operation principles

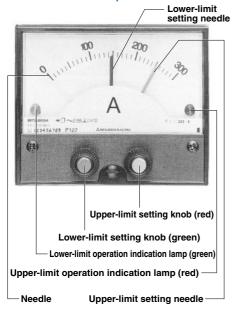

Non-contact detection

Non-contact detection occurs when the needle reaches the meter relay pick-up value or drop-out value, and is based on changing to the state where the light beam is shielded. For this reason, a protective plate is attached to the needle axis.

Switching circuit/Output relay section

The signal from the non-contact detection section is amplified via the switching circuit, activating the output relay.

Names of components

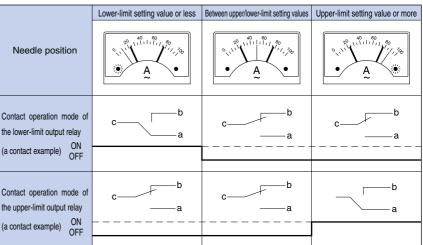

Upper/Lower-limit operation indication light.

This light turns on as soon as the value set as the upper/lower-limit is reached and stays lit as long as this state is maintained.

Outer dimensions

•Needle position and output relay operation

Remarks The needle position across the entire scale can be indicated by combining the contacts of the lower-limit and upper-limit output relays as shown in the diagram below.

Indi		1, 3, 5A	0	60mV(10mA)		100mV(10mA)		
	Combined with shunt	1~7500A	0	60mV(1	10mA)	100mV(10mA)		

Note 1. In the case of combined use with a shunt, please refer to the table below and specify the lead wire thickness and **Delivery period classification** one-way length or the round trip resistance

- Remarks (1) In the case of a bidirectional deflection indicator, determine the specifications according to the following.
 - In the case of a direct rating model, manufacture is possible if the larger of the right and left scales is 5A or less.
 - In the case where a shunt is externally attached, determine the scale so that the sum of the absolute values of the indicator ratings is 60mV or more for YM-210MRN and 100mV or more for LM-11MRN.
 - Example: In the case of a shunt rating of 500A and 60mV
 - Ammeter scale -500~0~+500A
 - Ammeter rating -60~0~+60mV (sum of absolute values=120mV≥60mV)
 - (2) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in
 - selecting the model and use specifications suited to the application.

Table of maximum allowable values of lead wires for DC ammeter relay combined with shunt

DC ammeter relay combined with shunt								
Indicator rating (mV)	Maximum allowable resistance value of lead wire (Ω)							
60 or more, less than 75	0.73							
75 or more, less than 100	1.16							
100 or more, less than 150	1.88							
150 or more	3.33							
100 or more, less than 150	1.50							
150 or more	2.59							
	Indicator rating (mV) 60 or more, less than 75 75 or more, less than 100 100 or more, less than 150 150 or more 100 or more, less than 150							

Remarks (1) Refer to "DC ammeter combined with shunt" on p.44 regarding the round trip resistance according to the lead wire thickness and one-way length.

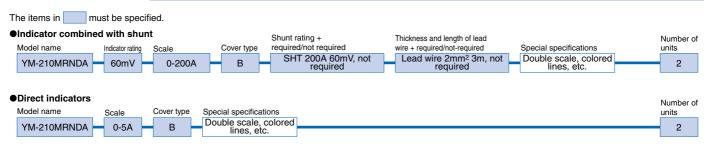

Lead wires for shunt connection

Lead wires for connecting an indicator with a shunt can be manufactured if specified.

The standard is: two 2mm² - 2m (one-way) 1500V heat-resistant vinyl wires (blue) for electric equipment.

Remarks (1) The customer is requested to prepare wires besides those of 2mm² cross-sectional area.

Remarks (1) Refer to the "Wattmeter Scale Selection Reference Table" (p.54) concerning the manufacturable maximum scale value of a wattmeter relay.

(2) The varmeter relays are bidirectional deflection indicators with "Zero" as the central division and with LEAD at the left side and LAG at the right side. Refer to the "Varmeter Scale Selection Reference Table" (p.60) concerning the manufacturable maximum scale value of a varmeter relay.

(3) Unidirectional deflection indicators can also be manufactured for varmeter relays. Please specify LEAD or LAG (standard is LAG).

(4) 1A current rating models are also manufactured (the consumption VA is similar to that of a 5A model).
(5) The T-150 rectifier is a dedicated accessory (non-compatible accessory) and thus cannot be used in combinations besides those specified for the indicators. The distance between the indicator and the T-150 rectifier must be 5m or less or the round trip lead wire resistance must be 0.5Ω or less.

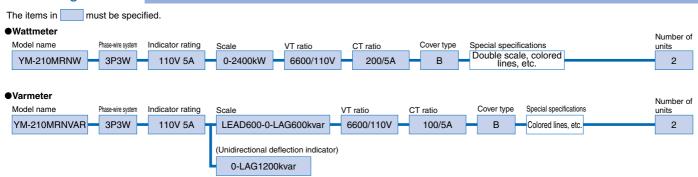

(6) The weight of the T-150 rectifier is approximately 1kg.

(7) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Precautions When Handling Meter Relays

•For meter relays, always keep the auxiliary power supply on. The consequences of turning the auxiliary power supply on/off are described below.

 $\overline{\nabla}$

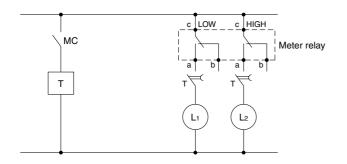

(Note) *Method for restoring normal operation after restoration from power interruption.

Turn the setting knob to move the needle setting in the order of (1), (2) as shown below. After this, reset the needle setting.

Relay output	Lowe	r limit	Upper limit			
Malfunction details	Relay output is ON (when it should be OFF)	Relay output is OFF (when it should be ON)	Relay output is ON (when it should be OFF)	Relay output is OFF (when it should be ON)		
Action	Image: Constraint of the second s	Lower limit Upper limit	Lower limit Needle	Lower Upper A limit limit Needle		

•If an inrush current that is generated when a motor is started exceeds the setting value even instantaneously, the relay operates during that state.

To prevent unnecessary influence of the relay during such a transition state of the input signal, use a timer to release the output relay terminals for a fixed time during starting to prevent unnecessary operation of a control device.

MC : auxiliary contact of electromagnetic switch for starting motor

T : timer L1, L2 : control device

Indicators with Maximum and Minimum Needles

These indicators have marker needles indicating the maximum and minimum values. The response time of these indicators is extremely fast.

- •The needle response time is 0.1s (0.3s for DC input).
- •The maximum value marker needle, minimum value marker needle and driving needle are red, green and black, respectively.
- •Using the indicators in combination allows the marker needles to be reset to the driving needle both manually and electromagnetically.

Note 1. Models with a rating exceeding 15ADC are provided with an externally mounted 300mV shunt. Additionally, in ordering, please specify the resistance value so that the lead wire round trip resistance value is 0.8Ω or less.

Remarks (1) Refer to p.90 and p.92 if an AC voltmeter is to be used as a ground voltmeter.

(2) The T-150 rectifier is a dedicated accessory (non-compatible accessory) and thus cannot be used in combinations besides those specified for the indicators. The distance between the indicator and the T-150 rectifier must be 5m or less or the round trip lead wire resistance must be 0.5Ω or less.

- (3) Set the duration of supplying electricity to the electromagnetic marker needle resetting terminal to within 5s. Additionally, use a switch that "opens" when released.
- (4) The overload capacity is 2 times the rated current for 2s.
- (5) For an AC ammeter or AC voltmeter, please specify the frequency.
- (6) An expanded scale cannot be manufactured for an AC ammeter.
- (7) Do not use with a circuit through which an inrush current or other current that exceeds the rating flows.
- (8) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Remarks (1) Please specify the VT ratio of the EVT used in accordance with the following examples.

 $\frac{6600}{\sqrt{3}}$ / $\frac{110}{\sqrt{3}}$ / $\frac{110}{3}$ V (specification example in the case where Vaf=110V) $\frac{6600}{\sqrt{3}}$ / $\frac{110}{\sqrt{3}}$ / $\frac{190}{3}$

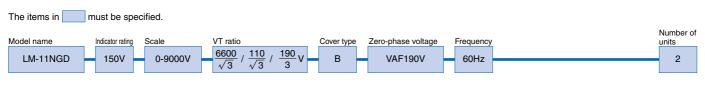

V (specification example in the case where Vaf=190V)

- Remarks (2) An alarm contact that is activated by the voltage relay when the zero-phase voltage (Vaf) is 50 to 75V (Vaf=190V) is standard equipment. Contact capacity: 100VAC, 1A (resistive load).
 - (3) In the case of using a VT that is not specially designed as a zero-phase transformer, a harmonics suppressing resistor (dummy load) is connected between open and delta. The resistor is selected according to the load of the voltage transformer and should comply with the following:
 - 200W 200Ω (200Ω±10%) when Vaf=190V
 - 150W 120Ω (120Ω±10%) when Vaf=110V
 - (4) Be careful of the following matters in using this indicator for telemetry. ① Please specify the resistance value if the lead wire resistance between the rectifier and the meter exceeds 15Ω (one-way).
 - (2) There are three communicating lines between the rectifier and the meter (not including the alarm circuit), and the differences among the resistance values of these lines must be 15Ω or less
 - (5) Please specify the frequency.

(6) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.

Connection diagrams

•Connection and VT ratio of EVT to be combined with a ground voltmeter (LM-11ZNAV or 11-YNAV) and an earth-leakage detector (LM-11NGD)

Generally, an EVT with which the zero-phase tertiary voltage in the 1-wire ground state is 110V (or 190V) is used in a YY \triangle (star-star-delta) connection. Although VAf is the input voltage of the ground voltmeter, the respective line voltages of the \triangle connection are input in addition to Vaf into an earth-leakage detector.

Note. With an arrangement without the tertiary winding in the above diagram, the voltage at the open end resulting from a secondary winding is considered as the zero-phase tertiary voltage.

•Scales of a ground voltmeter (LM-11ZNAV or 11-YNAV) and an earth-leakage detector (LM-11NGD) and the VT ratio

The earth-leakage detector is used in combination with an $YY \triangle$ -connected EVT, and this table shows the relationship between the line voltage VL-L and the scale and the VT ratio.

Circuit voltage	Indicator maximum		VT ratio (examples)	Zero-phase voltage	LM-11ZNAV	LM-11YNAV	LM-1	1NGD
V	scale value	When three 1-p	phase EVTs are used	When one 3-phase EVT is used	(Vaf)	Indicator	rating (V)	Indicator rating	Alarm relay operating

●There are two types of indicator maximum scale values, the nominal line voltage V_{L-L} and 1.36×V_{L-L}. (1.36 is the value in the case of 150V/110V.)

Regarding the indicator rating

- ○In the case of combining three LM-11ZNAV (LM-11YNAV) units or in the case of LM-11NGD The indicator rating is the line voltage at the △ connection side when the primary side is in the 1-wire ground state (however, the fault phase is excluded).
 ○In the case of using one LM-11ZNAV (LM-11YNAV) unit The indicator rating is the voltage corresponding to the zero-phase voltage Vaf.
- voltage V_{L-L} and 1.36×V_{L-L}. (1.36 is the value in the case of 150V/110V.) •The zero-phase voltage Vaf is the voltage at the open end of the open \triangle
- connection when the primary side is in the 1-wire ground state.The alarm relay operation voltage is related only to the zero-phase voltage
- (that is, the VT ratio) and has no relationship with the indicator scale.

Synchroscopes

- A synchroscope indicates the synchronization point (scale center) when the frequencies and the phases at a generator side and a bus line side are matched.
- •If the frequencies of both sides are equal, the position at which the needle is stationary indicates the phase difference between the two.
- •When the generator side (starting side) frequency is fg and the bus line side (operating side) frequency is fg, the direction of rotation of the needle is as follows:
 - When fg=fB The needle is stopped.
 - When $f_{G}>f_{B}$ The needle rotates in the FAST direction.
 - When $f_G < f_B$ The needle rotates in the SLOW direction.

Special sp	ecification		With phase angle sca	le (delivery period: \triangle)				

Remarks (1) The pull-in and dropout frequencies are 2 to 3Hz. That is, although the needle rotates up to a frequency

difference of 2 to 3Hz according to the difference and indicates whether the generator (or starting side) is slow or fast, when the difference becomes large, the needle moves slightly without rotating.

Delivery period classification								
Cumbal	©Standard	OQuasi-standard	∆Special					
Symbol	product	product	product					
Reference delivery period	Immediate delivery	Within 20 days	21 to 60 days					

- (2) The needle does not rotate when the frequency difference is large. In this case, judgments should be made using the light shown in the connection diagram. Please note that the light is not supplied; it is to be prepared by the customer if required.
- (3) The specifications are continuous rating specifications.
- (4) In a state where electricity is not supplied, the needle indicates an arbitrary position exceeding ±30° from the synchronization point.
- (5) The lead wire length from the main synchroscope unit to an accessory device must be set to 5m or less.
- (6) Please make sure to read the "Safety Precautions" (pp.5-8) and the "Selection Precautions" (p.9) to assist in selecting the model and use specifications suited to the application.
- (7) The scale must be specified. The standard specification is: SLOW-FAST.

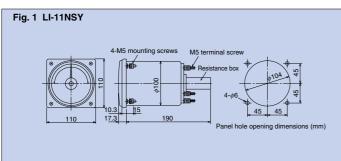

Phase angle scale

- •An indicator with phase angle scale, in which an angle scale centered at the synchronization point (scale center) is drawn, can also be manufactured.
- •The needle indicates the phase difference between the generator side and bus line side. The indicator can thus be used for measuring the phase difference when the needle is stationary or for timing of startup.
- •The standard phase angle scale is a 30° forward/backward scale.

side

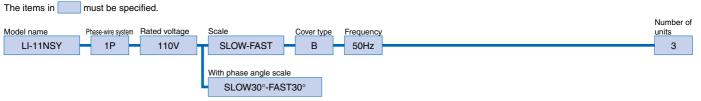

(2) Regarding light connection

- When combined with a VT, the same phase at the secondary side of the VT must be grounded.
- If a VT is not used (direct case), connect the same phases shown in the connection diagrams.
- The light will not flash if not connected.
- (3) Regarding light rating
 - A value twice the circuit voltage is generated between the light connection terminals (between L1 and L2). If a light of the same rating as the circuit voltage is to be used, connect two lights in series.

Example synchroscope light connection (for reference)

Ordering method

Dual-element Indicators

Two measured quantities are indicated by the same indicator.

- •Two independent movable coil indicators are incorporated, and by combination with a detector and a transmitter, two measured quantities, such as voltage and current, water level and water quantity, power and reactive power can be indicated by the same indicator to enable reduction in panel space. The indicator can be combined with power transducers to enable measurement of various electrical quantities.
- •The needle colors are black and red (the front side needle as viewed from the front face of the indicator is black and the rear side needle is red).

Connection diagram

Note 1. For low-voltage circuits, grounding of the secondary side of the instrument voltage transformer is unnecessary.

Ordering method

Applications

- Optimal as indicators for various process controls in power generating/transforming systems, steel plants and chemical plants, as well as general panel indicators.
- •Useful for changing the panel appearance and significantly reducing panel size.
- •Level differences of measured values can be compared easily by coupled mounting of indicators.

Products list

- ●There are four types of outer size (length) 100mm, 130mm, 150mm and 170mm.
- •All models are available in vertical and horizontal mount specifications.
- •For the FM model, both 1- and 2-needle meters can be manufactured.

Nameplate and tag number plate indication standards

Indications on nameplates and tag number plates shall be engraved according to the following standards. Orders with no specified nameplates or tag number plates will be delivered without nameplates or tag number plates.

1. Indication method

Method ······ Engraved/Ink Font ······ Round Gothic Material ····· ABS resin

2. Dimensions/Number of characters/Number of steps (vertical mount)

	Plate	F-210N	F-213N	F-215N	F-217N
	Effective area	9×28	11×32	15×38	25×38
Nameplate	Number of characters per column	9	9	9	9
	Number of rows	2	2	3	3
Tog number	Effective area	9×28	11×32	10×38	8×38
Tag number	Number of characters per column	10	10	10	10
plate Number of rows		1	1	1	1

●Effective area ……………………… Dimensions enabling effective indication of characters (height × width)

•Number of characters Maximum number of characters that can be entered in a single column

Number of steps ……… Number of character strings

•May differ from the standard size/position depending on the combination of the character string.

•Please inquire regarding horizontal mounting.

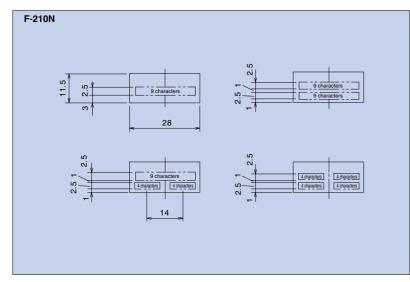

3. Style/Print color

Background color of nameplate • tag number plate	Print color	Outer frame color						
(B) Black Munsell N1.5	White	Outer frame: N1.5						
(F) Dark blue Munsell 7.5BG4/1.5	White	Outer frame: 7.5BG4/1.5						
(W) White Munsell N9/0	Black	Outer frame: N1.5 or 7.5BG4/1.5						

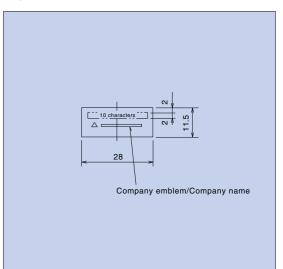

•If the background color is not specified, it will be the same color as the outer frame.

4. Model-wise indication standards

Nameplates

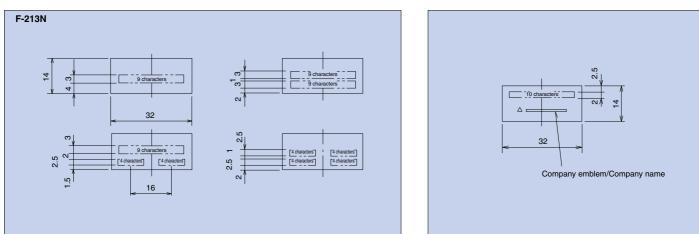

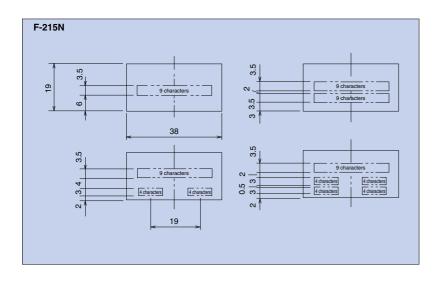

Tag number plates

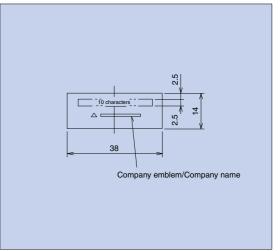

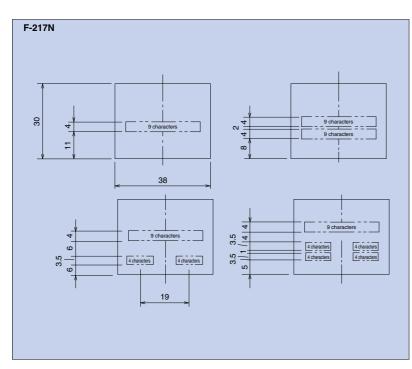

Nameplates

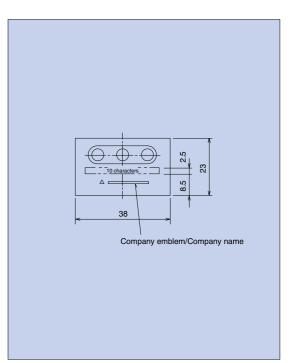

Tag number plates

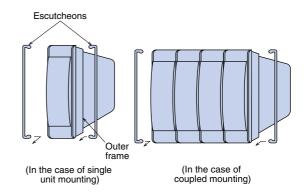

Mechanical Indicators

Bar-shaped Indicators

Handling precautions

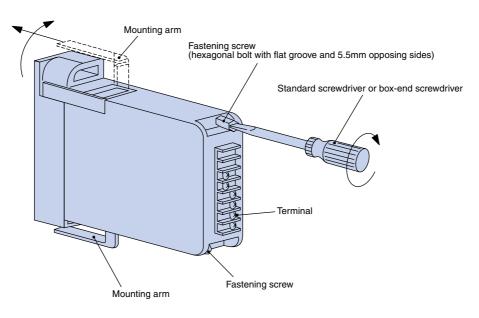

1. Using protective plates

- Protective plates are mounted to indicators so that the gaps between the indicator and panel cannot be seen. They are mounted to both sides of an indicator when a single unit is mounted, and mounted at both ends of the indicator when coupled mounting is used.
- Plate attachment
- Match and insert the upper and lower inner protrusions of each plate in the grooves of the outer frame at the rear of the indicator.
- The plates are coated the same color as the outer frame.
- The plates are packaged together with the indicator.
 F-213N does not have protective plates.

2. Mounting the indicator

• Push on the front face of the panel to insert the unit. Next, turn the fastening screws in the rear face of the main unit clockwise using a standard screwdriver or box-end screwdriver with 5.5mm opposing sides. In doing so, the mounting arms will be set automatically and fixed to the panel (thickness of corresponding panel: 1 to 6mm).

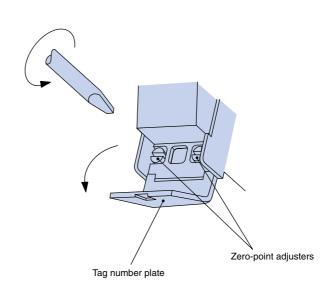

3. Zero-point adjustment

• For indicators other than F-217N, open the tag number plate using a standard screwdriver and use the zero-point adjusters inside to adjust the zero point.

Be careful not to apply excessive force to the adjusters.

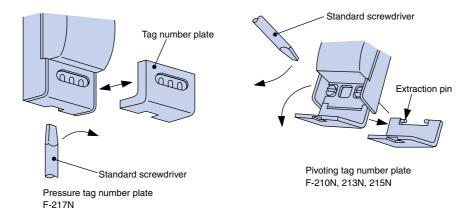

- For zero-point adjustment of the F-217N, use a standard screwdriver to adjust the zero point by turning the zero-point adjusters on the front face.
- If the unit is equipped with a zero-suppressed indicator, perform adjustment while applying electricity equivalent to the minimum scale value; for example, 4mA in the case of 4 to 20mA.

4. Disassembling of nameplates, tag number plates, covers and scale plates

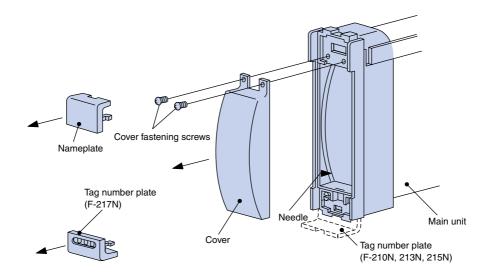

- Procedure 1. Remove the nameplate and tag number plate.
 - For pivoting tag number plates, remove the extraction pins at the rear. Remove while lifting the indicator approximately 5mm from the panel surface.

(The pivoting tag number plate does not need to be removed to remove the scale plate.)

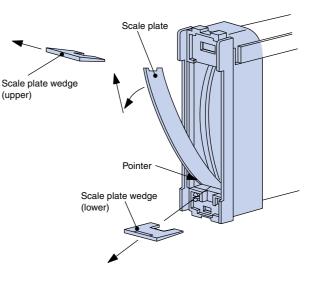

2. Remove the cover fastening screws.

3. To remove the cover, pull the upper side of the cover forward slowly and then lift slightly.

- 4. To prevent deformation of the needle, turn the zero-point adjuster and move the needle to the lower side.
- 5. Draw out the scale plate wedge toward the front.
- 6. The scale plate can be removed when the upper side (nameplate side) of the scale plate is slowly drawn outward and lifted slightly.
- Note: Be careful not to deform the needle when removing the scale plate.

Transducers

Overview and Features

High performance realized in a compact module. Single function models T-51/T-101 Series

Power K Series (ordinary class, fixed-load output) H Series (ordinary class, constant-voltage/constant-current output) S Series (precision class, constant-voltage/constant-current output)

and Peripheral

Instrumentation An assortment of box models with power, instrumentation and peripheral elements arranged in compact modules.

Mitsubishi Electric transducers

Product name Shape		Power transducers											Instrumentation transducers									Peripheral transducers									ecial

Now even easier to use.

Collective transducers T-120 Series

Multi-use transducers that allow the input of various electric quantities from instrument transformers (VT, CT), and output DC signals and pulses.

•4 modes of mounting

As standard specifications, the T-51, T-101 and T-120 Series can be mounted four ways: mounting legs, IEC rail (35mm), distribution panel breaker mounting plate, and mounting tabs.

Distribution panel breaker mounting plate

Transducers

IEC rail (35mm)

Distribution panel breaker mounting tab

Compact modules that facilitate panel designing

The realization of compact modules was pursued. There are 2 types of outer dimensions. (T-51/T-101 Series)

Self-lifting screws utilized for input and output terminals Wiring work is easier if self-lifting screws are used.

(T-51/T-101/T-120 Series)

Equipped with power supply indicator

An auxiliary power supply indicator (red LED) that indicates operating state is provided. (excluding the T-51K and T-120 Series)

Mitsubishi Electric electronic technologies fully integrated

In addition to carefully selected electronic parts, the design considers lighting/switching surges and noise.

Select the optimal model according to the application

Single function models Power, instrumentation and peripheral transducers

- K Series Ordinary class, fixed-load output
- H Series Ordinary class, constant-voltage/constant-current output
- S Series----- Precision class, constant-voltage/constant-current output
- Collective Multi-use for power applications

Safety Precautions

Please pay attention to the following items when using transducers.

Read the instruction manual attached to the product before performing settings or using the device.

For safety reasons, mounting and connection work should only be performed by a professional electrical wiring technician.

1 Precautions concerning usage environment and usage conditions

Do not use in the following locations. Use in such locations may lead to malfunction, significant error or reduced service life.

- Locations where the ambient temperature is outside the range of -10°C~50°C.
- •Locations where the average daily temperature exceeds 35°C.
- •Locations where the humidity is outside the range of 30%RH~85% RH (no condensation).
- Locations with excessive dust, corrosive gases, salinity or oil fumes.
- •Locations with excessive vibration or impact.
- •Locations directly exposed to rain, water drops or sunlight.
- •Locations with excessive external noise.
- •Locations at an altitude of 1000m or more.
- Locations where a strong electric field or magnetic field is generated.
- •Locations where there are metal pieces or inductive substances present.

2 Mounting precautions

Please pay attention to the following items regarding mounting.

- •The transducers must be mounted inside a panel.
- Tighten the mounting screws using the following torques:

M4 iron screws 1.47~1.86N•m
M4 brass screws 0.88~1.08N•m
M5 iron screws 2.94~3.43N•m
M5 brass screws 1.67~2.06N•m

3 Connection precautions

Please pay attention to the following items regarding connection.

- •Use the specified materials and diameters for the electrical wires that connect the output and load of transducers in order to prevent failure due to external noise or surges.
- •Use the following crimp terminals.

Series	Applicable crimp terminals	Tightening torque
T-51, T-101	Round crimp terminals (outer diameter: ϕ 8.5 or less) for M4 screws	0.98~1.47N•m
T-120	Round crimp terminals (outer diameter: ϕ 8.3 or less) for M4 screws	0.96~1.4711•111
1-120	Round crimp terminals (outer diameter: ϕ 7.1 or less) for M3.5 screws	0.61~0.82N•m

Although transmission distances for standard combinations are indicated in this catalog, the values are to be used when there is no interference (e.g., induction voltage, surge) in the transmission line. If installation of the transmission line parallel to power cables is unavoidable and there is a possibility of inductive interference, use a shielded transmission line to avoid interference during use.

- Power factor and reactive power transducers will not operate correctly when connected as a reverse phase sequence. Use with the correct phase sequence.
- •When a device, such as a harmonics transducer for measuring harmonic voltage is connected to a VT, do not remove the auxiliary power supply of multi-use or harmonics transducers from the VT. The harmonic voltage may not be measured correctly.
- In regard to grounding in the connection diagrams, grounding of the secondary sides of the VT and CT is unnecessary for low-voltage circuits.

Connect correctly

Check the connection diagrams carefully before making connections. Erroneous connections may cause equipment to scorch or catch fire.

Fasten terminal connections securely

Fasten electrical wires securely to the terminals. Otherwise, overheating, equipment burnout or fire may occur.

Do not perform work with live wires

Do not perform connection work with live wires. Electrical shock, electrical burns, equipment burnout or fire may occur.

Do not open the secondary side of a CT circuit

Ensure that the signal on the secondary side of the CT is connected correctly to the CT connection terminals. Incorrect connection of the CT or opening the secondary side of the CT will cause high voltage on the secondary side of the CT, and may lead to equipment failure, electrical shock or a fire.

Do not short-circuit the secondary side of a VT circuit

Ensure that the secondary side of the VT is correctly connected to the VT connection terminals. Incorrect connection of the VT or short-circuiting the secondary side of the VT will cause a large overcurrent to flow through the VT secondary winding, which will lead to equipment failure, electrical shock or fire.

4 Precautions concerning preparation before use

Please read the following items before use.

(1) Transport

Avoid application of vibration and impact as much as possible during transport.

In situations where it is possible that transducers will be subject to excessive vibration or shock, remove the transducer from the panel before transportation.

(2) Check the model name and rating

As a precautionary measure, check the model name and specifications such as input, output and auxiliary power supply before use.

(3) Adjustment

Generally, transducers are adjusted before shipment from the factory and do not require adjustment. To perform adjustment for matching with receiving-side equipment, perform adjustment while avoiding the application of excessive force to the adjusters. Not doing so may cause failure of the adjusters.

Avoid touching the adjusters in ordinary circumstances.

(4) Insulation resistance test and withstand voltage test Please read the following carefully before performing an insulation resistance test or voltage test. Not doing so may cause failure.

Do not perform a withstand voltage test between input and output for non-isolated models

For instrumentation transducers where the input and output circuits are not insulated, do not perform withstand voltage testing between the input and output. Breakage will occur.

The withstand voltage test will cause the dielectric breakdown of internal elements, and may cause equipment failure or fire.

5 Usage precautions

Please pay attention to the following items during use.

Use transducers according to their ratings

Use transducers according to their ratings. Not doing so may cause significant error, failure or fire due to overheating.

For input values outside the rating range, the output value will be outside the rating range.

Ensure the settings are correct

For models requiring settings, read the relevant instruction manual carefully before performing settings. Setting errors or unset items may cause abnormal operation and alarms may not function properly for receiving-side equipment; for example, if no value is set, no alarm will be activated for the output signal.

Do not lower the input voltage

With the active power, reactive power, power factor, phase angle and frequency transducers, an error may occur if the input voltage is outside the specified operating range (guaranteed value: 90~110% of the rated voltage).

Additionally, malfunction may occur if the input voltage drop is significant (less than 60% of the rated voltage).

6 Precautions concerning repair upon failure and treatment of abnormality

If an instrument malfunctions contact the nearest branch of Mitsubishi Electric System Service Co., Ltd. or Mitsubishi Electric.

7 Maintenance and inspection

Please pay attention to the following items regarding maintenance and inspection. Refer to p.174 for details.

Make sure to turn off the power for maintenance and inspections

When performing maintenance and inspections of transducers, be sure to turn off the power supply to the circuit connected to the transducer.

Electrical shock, electrical burns, equipment burnout or fire may occur if removal is attempted in the live-wire state.

8 Storage precautions

Do not store transducers for long periods in the following locations.

- ●Locations where the ambient temperature is outside the range of -20~60°C.
- •Locations where the average daily temperature exceeds 35°C.
- •Locations where the humidity is outside the range of 30%RH~85%RH (no condensation).
- •Locations with excessive dust, corrosive gases, salinity or oil fumes.
- •Locations with excessive vibration or impact.
- •Locations directly exposed to rain and/or water drops.
- •Locations where there are metal pieces or inductive substances present.

When storing transducers, turn off the power, remove the wiring such as those for input/output/auxiliary power supply and place in a plastic bag.

Make sure to turn off the power before removal

In removing a transducer for storage, make sure to turn off the power supply of the circuit connected to the transducer.

Electrical shock, electrical burns, equipment burnout or fire may occur if removal is attempted in the live-wire state.

9 Disposal precautions

Dispose of the product appropriately according to the "Waste Management and Public Cleansing Law." This product does not use batteries.

•WARRANTY

- •The warranty period is 1 year from the date of purchase or 18 months after manufacture, whichever is earlier. Even during the warranty period, repairs for failure due to an intentional or negligent act by the customer shall be charged.
- •Mitsubishi Electric shall not be liable for warranty against damages resulting from reasons not attributable to the company, opportunity loss and/or lost earnings on the customer's part due to malfunction of a Mitsubishi product, damages resulting from special circumstances whether foreseeable or unforeseeable by Mitsubishi, secondary damages, accident compensation, and damages and other services besides those of a Mitsubishi product.

Product service life

- •The expected life of a transducer is 10 years.
- * The expected service life is the period or number of operations for which the transducer can be used without functions deteriorating to a level that impairs practical use, on the condition that the equipment or materials are used in accordance with standard specification conditions.
 Please note that the expected service life is only a guide and performance is not guaranteed for this period.
 (Excerpt/Summary of "Expected Service Life of Electrical Equipment," in the September, 1998 issue of the Journal of the Institute of Electrical Installation Engineers of Japan.)

•Recommended exchange period

 The recommended exchange period for transducers is seven years.

Requests Regarding Selection

1 For remote measurement, select a large output value.

When performing remote measurements, as a general rule, use a local transducer and ensure that transmissions are made according to the output side of the transducer; that is, ensure that the output side is not pulled over a long distance. Additionally, select a large output value; for example, 4~20mA.

2 Select an H or S Series model if the load resistance varies.

When the load resistance to be connected to the output terminals of a transducer is unknown, or where there is a possibility for future increases in load, select a constant-voltage, constant-current output transducer such as a model from the H or S series.

3 Select a model with an effective value if the input waveform becomes distorted.

AC-input transducers are calibrated based on sinusoidal input. In addition, depending on the model, error may occur when the input waveform is distorted due to the operating principle. Therefore, if there is waveform distortion, select an effective-value model with comparatively low error such as T-101SAA or T-101SAV.

4 Select a phase-angle transducer for unbalanced loads if the three-phase loads are unbalanced.

Phase-angle transducer errors may occur if the three-phase loads of balanced circuits become unbalanced. Select a phase-angle transducer for unbalanced loads such as T-101HPA(U) or T-101SPA(U) if it is possible that the three-phase load will be unbalanced.

5 Error may occur when the input current is extremely low (phase angle, power factor).

When using a phase angle or power factor transducer, error or malfunction may occur when the input current drops significantly lower than the rated current. Therefore, when selecting the rated primary current of a CT, ensure that the secondary current during actual use is 1/3 or more of the rated secondary current of the CT.

6 Check the electricity pulse unit (active and reactive).

Be certain to first check the restrictions applying to the value to be set for the electricity pulse unit (active and reactive) for multi-use transducers.

7 The standard bias/span ratio of the rated values of a transducer is 1/4 or less.

Cases where the bias/span ratio is larger than 1/4 can be supported by increasing the class index by multiples of 1/4 only.

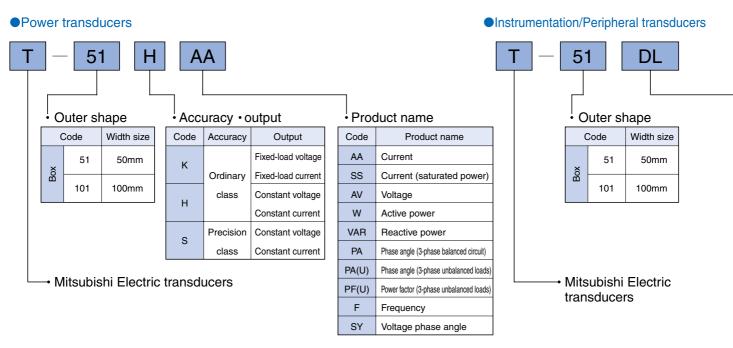

- (Example 1) In the case where the output value is 4~20mA, the bias is 4mA, the span is 16 (=20-4)mA, and the bias/span ratio is thus 4/16=1/4.
- (Example 2) In the case where the output value is $12 \sim 20$ mA, the bias is 12mA, the span is 8 (=20 12)mA, and the bias/span ratio is thus 12/8=3/2. This is six times the abovementioned ratio of 1/4 and is accommodated by selecting a model with which the class index is multiplied by six; for example, if the class index is 0.25, $0.25 \times 6 =$ class 1.5.

■"Inherent active power" of active power transducers

An active power transducer can be manufactured if the transducer's inherent active power $(P_o = \frac{\text{primary-side active power (kW)}}{\text{VT ratio} \times \text{CT ratio}})$ is within the range of the table on the left.

In the case of positive/negative bidirectional input, calculate using the larger of the positive or negative active powers.

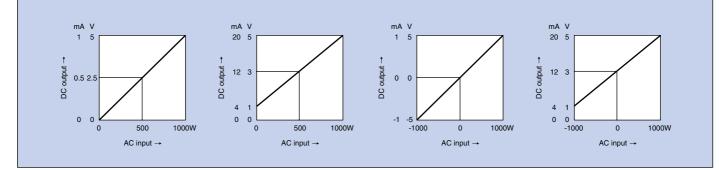

* The primary-side active power (kW) mentioned here is not the full-load active power based on the VT-CT rating. It refers to the active power value kW (i.e., primary-side active power value corresponding to the rated output value) to be controlled according to the load state (e.g., light load). (equivalent to the scale of the indicator)

Inherent active power value calculation example

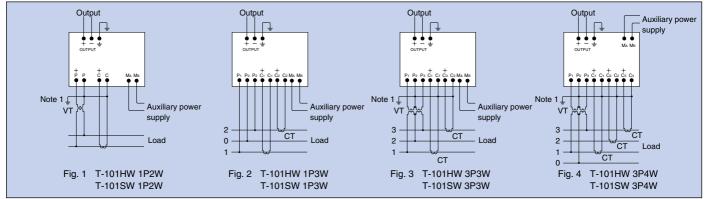

In the case of a 3-phase, 3-wire, VT 6600/110V, CT 200/5A arrangement with the primary side power being 2000kW:

Transducer inherent active power $P_0 = \frac{\text{primary-side active power (kW)}}{\text{VT ratio} \times \text{CT ratio}} = \frac{2000 \text{kW}}{6600/110 \times 200/5} = 0.833 \text{ (kW)}$

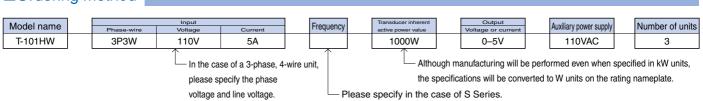

Input/Output relationships

Connection diagrams (Refer to p.156 for outer dimensions.)

Note 1. For low-voltage circuits, grounding of the secondary side of the instrument voltage transformer and current transformer is unnecessary.

		4~20mA	
	LEAD 0~1kvar	0~100mV	
		0~5V	

"Inherent reactive power" of reactive power transducers

A reactive power transducer can be manufactured if the transducer inherent reactive power ($Q_0 = \frac{\text{primary-side reactive power (kvar)}}{1000}$ VT ratio \times CT ratio is within the range of the table on the left. In the case of bidirectional input, calculate using the larger of the lag or lead reactive powers.

* The primary-side reactive power (kvar) mentioned here is not the full-load reactive power based on the VT-CT rating. It refers to the reactive power value kvar

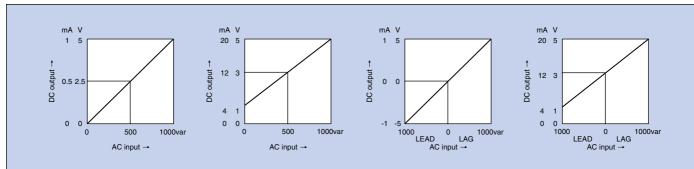

(primary-side reactive power value equivalent to the rated output value) to be controlled according to the power factor.

Inherent reactive power value calculation example

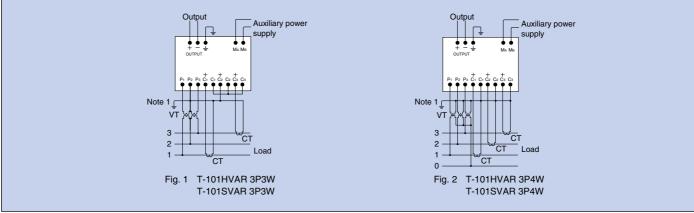

In the case of a 3-phase, 3-wire, VT 6600/110V, CT 200/5A arrangement with the primary-side reactive power being 1200kvar:

Transducer inherent reactive power Q₀ = primary-side reactive power (kvar) 1200kvar = 0.500 (kvar) VT ratio × CT ratio 6600/110 × 200/5

Input/Output relationships

Connection diagrams (Refer to p.156 for outer dimensions.)

*3 In the case of unidirectional input, the lag side (LAG) is the reactive power unless particularly specified.

*4 A CT must be inserted and used in the current circuit because reactive power transducers are three-current systems.

*5 Operation will be abnormal when the input of the three-phase circuit is a negative-phase sequence.

Note 1. For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

*3 When only the auxiliary power supply is applied, a value close to a phase angle of 0° (power factor of 1) is output.

*4 Use a transducer "for unbalanced loads" if there is a possibility for the 3-phase load to become unbalanced.

*5 With transducers for both balanced circuits and unbalanced loads, an error may occur when the 3-phase voltage becomes unbalanced.

*6 Operation will be abnormal when the input is a negative-phase sequence.

Note 1. For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

DC Level Transducers [Non-insulated]

T-51/T-101 Series

DC level transducers input DC voltage (or current) and output DC voltage or a DC current proportional to the input, and can be used for level conversion or as a buffer for power transducer output.

Use an isolator when insulation is required between the input and output.

Applications

- •Level conversion or buffer between various equipment
- •Level conversion or buffer for power transducer output

DC Reverse Transducers [Non-insulated]

T-51/T-101 Series

DC reverse transducers input DC voltage (or current) and output DC voltage or DC current inversely proportional to the input; for example, as the input signal increases from 0% to 100%, the output signal decreases from 100% to 0%.

Applications

- Monitoring of deviation amount in combination with devices such as a position detection sensor or temperature transducer
- •To create a fail-safe arrangement in the event of losing control power supply

Isolators [Insulated]

T-51/T-101 Series

Isolators provide insulation between DC circuits and measurement equipment, and between various sensors and control equipment.

Isolators can be used as a buffer or level exchange between input/output.

Applications

- Insulation between DC circuits and measurement equipment
- Insulation interface between each sensor and other equipment such as computers or data loggers

Insulation between separate circuits

Specify three values for bidirectional output.

Limiters [Non-insulated]

T-51/T-101 Series

Limiters restrict the variation range of an output signal and restrict the output to values outside the preset limit range when a signal outside the limit range is input. CAL signals proportional to setting values are output, allowing accurate settings and set

values to be checked.

Applications

- Maximum and minimum value retention during abnormal operation of a control device
- Prevent full opening/closing of devices such as control valves
- Prevent of off-scale input to computers

Specify three values for bidirectional output.

Adders [Non-insulated]

T-51/T-101 Series

Applications

Adders can be used to input several DC voltages or direct currents, perform addition according to the specified ratio, and output a DC voltage or direct current proportional to the addition result. An adder can also be used to perform actions such as concentrating power when combined with a power transducer.

•Synthesis of active powers (reactive powers) of multiple circuits

Manufacturable range

		T-101AD		
Input		50mV~10V, 0.5~20mA		
Output		0.1~20mA, 50mV~10V		
Auxiliary	AC	100, 105, 110, 115, 120V ₊₁₀ 200, 210, 220, 230, 240V ⁻¹⁵ %		
power		200, 210, 220, 230, 240V		
supply	DC	24V±10%		

Method for designating addition proportions *1

For example, if the inputs are PA=5V (1000kW), PB=5V (3000kW) and Pc=5V (5000kW), and the output is 5V (9000kW), the addition proportions = $\frac{1}{9}$: $\frac{3}{9}$: $\frac{5}{9}$

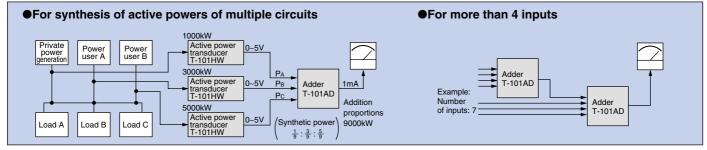

*2 If the number of inputs exceeds four, addition can be performed using 2 or more adders.

*3 Adders that provide positive/negative bidirectional output or positive direction-only output for positive/negative bidirectional input can also be manufactured. The manufacturable ranges for bidirectional output are $\pm 50 \text{mV} \sim \pm 10 \text{V}$ and $\pm 0.1 \sim \pm 5 \text{mA}$.

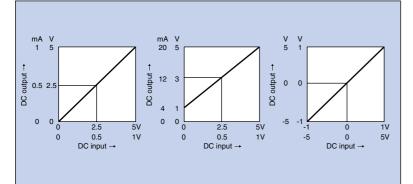

*4 The input and output are not insulated.

- *5 For 4–20mA, an input of 0mA is regarded as -4mA for calculations.
- *6 For 1–5V, an input of 0V is regarded as -1V for calculations.

Cu10Ω (at25°C)	100°C	(Please specify for cases other than listed above.)						
Ni and resistance bulbs other than the above	Please specify the resistance bulb.	e input temperature range and the temperature/resistance value relationship of the						

Selection between insulated/non-insulated (between input and output)

Make a selection according to the temperature sensor configuration explained in the following table.

Temperature sensor	Temperature transducer
Insulated with respect to the object measured	Both insulated and non-insulated units can be used. However, if the temperature sensor is located close to a power supply line or control equipment, common mode noise due to electromagnetic induction may occur. Use an insulated unit in this case.
Non-insulated with respect to the object measured	Make sure to use insulated units to prevent circuit noise interference due to the common potential generated in temperature sensors and the penetration of external noise.

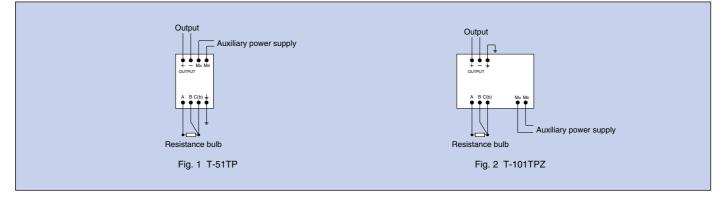

Input/Output relationships

Inspection and adjustment

Perform the following procedure to check whether or not a transducer is operating normally.

- ① Install an inspection resistor at (near) the installation location of the resistance bulb and connect the inspection resistor.
- ② Check whether or not the transducer outputs a value corresponding to the inspection temperature. If there is an error in output, adjust the transducer using the output adjuster.
- A GR-2 standard resistor (sold separately) can be used as an inspection resistor (see p.149).

Connection diagrams (Refer to p.156 for outer dimensions.)

Ordering method

Selection between insulated/non-insulated (between input and output)

Please make a selection according to the temperature sensor configuration explained in the following table.

Temperature sensor	Temperature transducer
Insulated with respect to the measured object	Both insulated and non-insulated units can be used. However, if the temperature sensor is located close to a power supply line or control equipment, common mode noise due to electromagnetic induction may occur. Use an insulated unit in this case.
Non-insulated with respect to the measured object	Make sure to use an insulated unit to prevent circuit noise interference due to the common potential generated in temperature sensors and the penetration of external noise.

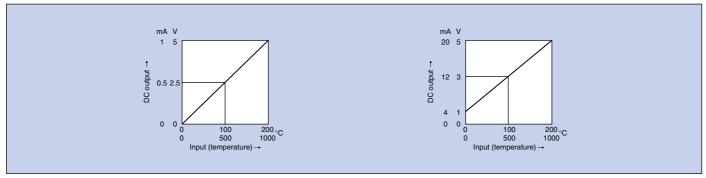

Inspection and adjustment

Perform the following procedure to check whether or not a transducer is operating normally.

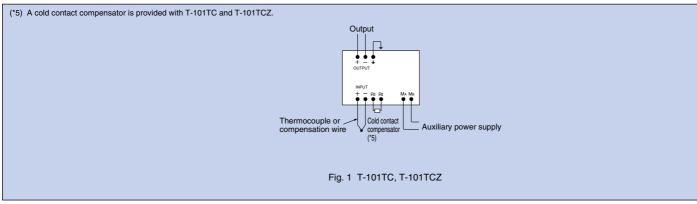

(The inspection temperature is the maximum input temperature.)

- Measure the temperature (reference temperature) in the immediate vicinity of the transducer.
- (2) Using the thermal electromotive force table in JIS C 1602, please note the thermal electromotive forces corresponding to the transducer maximum input temperature and the reference temperature.
- ③ Apply a DC voltage equivalent to (electromotive force of the maximum input temperature electromotive force of the reference temperature) to the input side of the transducer.
- (4) Check whether or not an output equivalent to the maximum input temperature is output. If there is an error in the output, adjust the transducer using the output adjuster.

*1 Accuracy of time interval (to): ±20% The accuracy of the time interval is the accuracy of the time at which the output reaches a value corresponding to 95% of a fixed value when input.

*2 Error may occur when the waveform of the input current is distorted. For example, when the third harmonic content is 15%, the error is approx.±2.0%.

Input/Output relationships

mA V mA V 5 20 5 1 DC output → DC output → 12 3 0.5 2.5 4 0 0 0 0 2.5 0.5 2.5 0.5 А А 0 AC input AC input

Connection diagrams (Refer to p.156 for outer dimensions.)

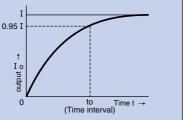

Note 1. For low-voltage circuits, grounding of the secondary side of the current transformer is unnecessary.

Ordering method

Model name	Input]	Time interval	Output		Auxiliany power oupply	Number of unite
Wodername	Current		Time interval	Voltage or current	Auxiliary power supply		Number of units
T-101HAA (DS)	5A		180 seconds	4-20mA		110VAC	1

The time interval (to) refers to the time required for an output (lo) to reach a value corresponding to 95% of a fixed input value (I) when the input (I) is applied continuously.

The output becomes substantially 100% at 3 times the time interval (3to).

AC Voltage Demand Transducers (Moderate Time Interval) [Insulated]

T-51/T-101 Series

AC voltage demand transducers output DC current or DC voltage that is proportional to the average value (demand value) of the AC voltage within a specified time interval.

Applications

- Monitoring of voltage due to load fluctuation
- For detecting abnormal voltages in devices such as small-scale generators
- For preventing the detection of error due to flicker

*1 Accuracy of time interval (to): ±20% The accuracy of the time interval is the accuracy of the time at which the output reaches a value corresponding to 95% of a fixed value when input.

*2 Error may occur when the waveform of the input voltage is distorted. For example, when the third harmonic voltage is 15%, the error is approx. $\pm 2.0\%$.

Input/Output relationships

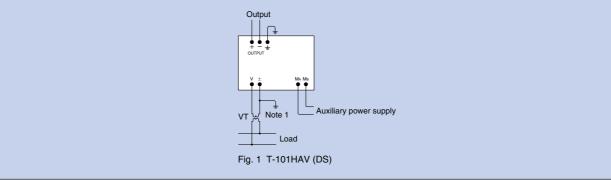

Connection diagrams (Refer to p.156 for outer dimensions.)

Note 1. For low-voltage circuits, grounding of the secondary side of the instrument voltage transformer is unnecessary.

Current Transducers with Power Flow

T-51/T-101 Series

Current transducers receive the current and voltage of 3-phase AC circuits as input, distinguish the power flow direction (receiving or sending), and output DC current or DC voltage proportional to the current value that was input.

Leakage Current Transducers [Insulated]

T-51/T-101 Series

Leakage current transducers detect leakage current in AC cables using a Zero-current transformer (ZCT) and output DC current or DC voltage proportional to the leaking current value.

Applications

- Preventive and predictive maintenance management of insulation degradation in electrical equipment
- Detection of leakage current in AC cables

Delivery period classification

*2 When a harmonic component is contained in the measured circuit, the T-51LG measures the effective value of the leakage current including

The ZCT is a dedicated accessory, and thus cannot be used in

If the power supply frequency (fi) and output frequency (fo) are connected close to each other in the inverter circuit, a beat may occur

An error of approximately 0.4% may occur if an external magnetic field

The measurement circuit (input side) and output circuit can be insulated

(Refer to p.146 for outer dimensions of the ZCT.)

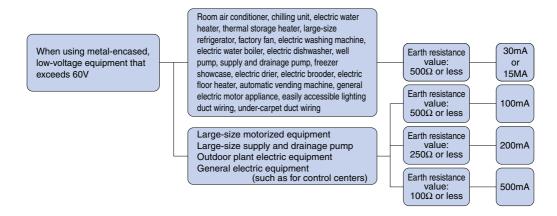

Reference : Rated input current value selection method

1 Monitoring leakage current due to insulation degradation of loaded equipment

Install the ZCT in the immediate vicinity of the loaded equipment.

The sensitivity current of an earth leakage circuit breaker is determined as indicated below. Select an input current value that is 1 to 1.5 times the value indicated below.

Example: Selecting a sensitivity current according to the electrical shock protection of an earth-leakage circuit breaker.

2 Monitoring leakage current in a long cable wiring

Even if the insulation resistance (meg) is normal, floating capacitance is present between the electric line and earth, and some leakage current flows constantly. This must be taken into account when selecting the input current value. An example of a 3-phase, 3-wire 200V circuit is shown in Table 1.

The rated current value is the sum of the value determined in Table 1 and the value determined in Reference 1 above.

Table 1 Leakage currents when 1km of 600V vinyl cable (IV) for \triangle connection 3 ϕ 3w 200V cable wiring is installed.

Distance from earth portion	A 4m or more	B 10cm or more	© 1.5mm or more	D Close contact

Leakage Current Transducers

T-51/T-101 Series

These transducers detect the leakage current in AC cables using a ZCT, attenuate the harmonic component contained in the current using a built-in low-pass filter, and output DC current or DC voltage proportional to the fundamental leakage current value.

Applications

 Measurement of the fundamental leakage current in inverters, thyristor control circuits, or other AC circuits that contain a harmonic component.

Outer dimensions of the ZCT unit

Ordering method

Voltage (Rise/Drop) Detectors [Insulated]

T-51/T-101 Series

<1-phase/3-phase>

These detectors instantaneously detect a voltage drop (or rise) compared to a previously set value, an open phase or a reverse phase (only for 3-phase) in 1-phase or 3-phase AC circuits and output a contact signal.

A "CAL signal" proportional to a preset value is output to enable accurate setting and checking of the value set.

Applications

- Detecting flicker and instantaneous power interruption
- Monitoring computer power supply

Detecting open phases, reverse phases (only 3-phase AC circuits)

Filters

A ripple (AC component) of approximately 5% P-P is contained in the output of K Series models. Use this filter if the ripple is to be reduced to 1% P-P or less.

Delivery period classification						
Symbol	©Standard	○Quasi-standard	∆Special			
Symbol	product	product	product			
Reference delivery period	Immediate delivery	Within 20 days	21 to 60 days			

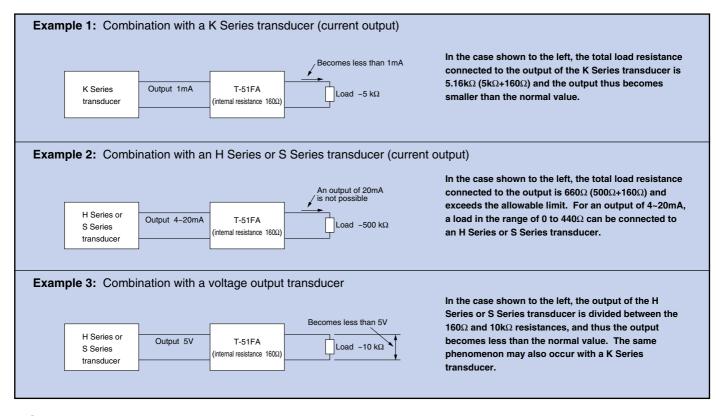

Model name		Input and output	Internal resistance	Output ripple	Weight	Delivery period classification
	Voltage	±20V max.	- approx. 160Ω	1% P-P or less	0 Eka	0
T-51FA	Current	±30mA max.			0.5kg	

*1 The H Series and S Series transducers do not require the use of T-51FA because the output ripple is 1% P-P or less.

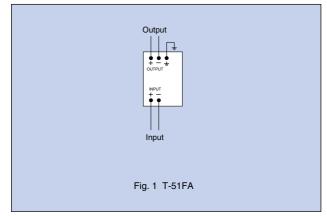

*2 T-51FA is not necessary when a transducer and an indicator (Mitsubishi Electric L or Y models) are used in combination.

Warning

The internal resistance of T-51FA is approximately 160Ω . Please note that problems such as the examples listed below may occur.

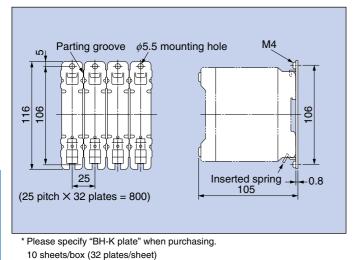

Connection diagrams (Refer to p.156 for outer dimensions.)

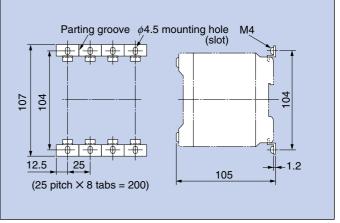

Auxiliary Parts

1. T-51/T-101 Series mounting parts

•Breaker mounting plate for distribution panel

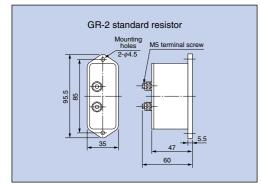

•Breaker coupling/mounting tabs for distribution panel

* Please specify "BH-K coupling tabs" when purchasing.
 80 sheets/box (8 tabs/sheet)

2. GR-2 standard resistor

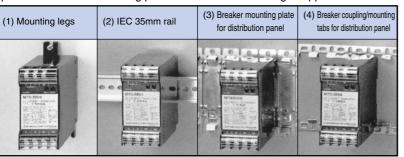

Used to inspect resistance-bulb temperature transducers (T-51TP, T-101TPZ). Incorporates a resistance value corresponding to the rated input temperature.

Method for mounting inside panels

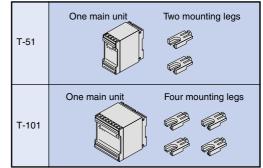

Mounting work is to be performed by a person with the proper technological expertise. •The following four types of mounting can be performed for models with standard

specifications. The mounting parts can be used according to application.

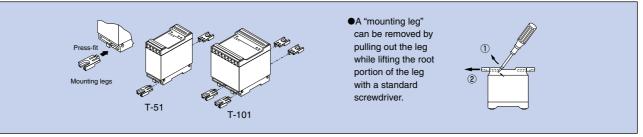

Accessories

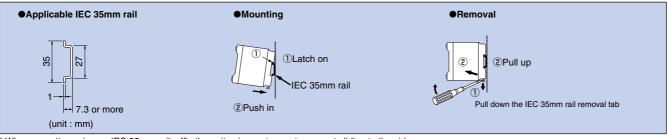

Mounting legs are packaged together with the main unit as accessories.

(1) Using mounting legs

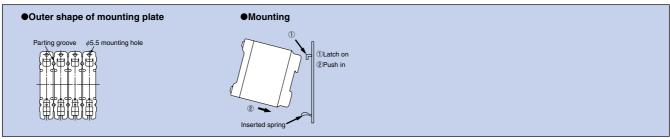

(2) Using an IEC 35mm rail

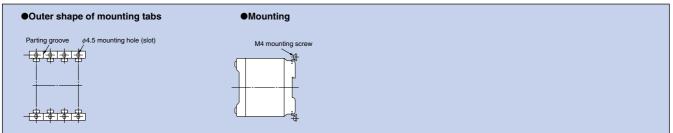

* When mounting using an IEC 35mm rail, affix the unit using a stopper to prevent sliding to the side.

(3) Using a breaker mounting plate for distribution panel

(4) Using a breaker coupling/mounting tabs for distribution panel

Snap-fit terminal cover

- The terminal cover is fitted onto the partition walls of the terminal section and can be easily removed.
 The cover can also be removed by placing the tip of a standard screwdriver into a slot along the side edge of the terminal cover.
- To attach the terminal cover, simply push the cover back into place.
- A nameplate can be inserted in the slot along the side edge of the terminal cover to indicate a signal name or equipment number.

The customer is requested to provide the nameplate.

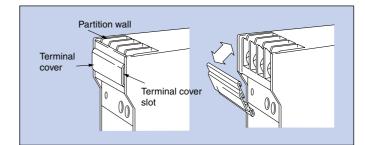

Outer shape	Nameplate dimensions
T-51	t0.8~1×7.5×45
T-101	t0.8~1×7.5×95

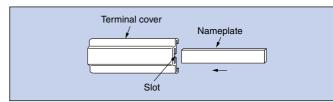

For safety reasons, use an insulating material as the material of the nameplate.

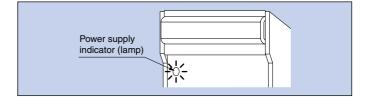

Power supply indicator (lamp)

An indicator (red LED) that shows current is being in supplied from an auxiliary power supply is provided (except for K Series).

Use this for daily inspection and as a guideline for judging whether or not the device is operating.

Handling

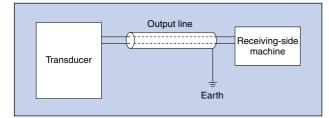

T-51/T-101 Series

Wiring

Connection work is to be performed by a person with the proper technological expertise.

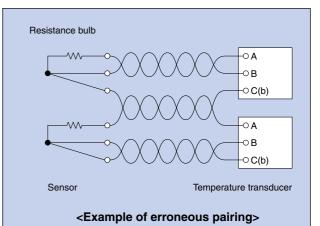

- Connections must be made correctly and securely.
 Be careful because erroneous wiring not only causes malfunctions and damages equipment, but may also spread problems to other power equipment.
- •As the lead wires for connecting the output and load of a transducer, use two-core shielded wires or twistedpair wires to prevent malfunction and failure due to transmission noise and disturbance surge. If the transmission distance exceeds 100m, current output specifications; for example, 4~20mA DC are recommended.
- •Do not bring the output line close to or bundle it together with other power lines and the input lines (i.e., VT, CT and auxiliary power supply).
- Although the H Series, S Series, instrumentation and peripheral transducers are provided with auxiliary power supply terminals, if the voltage of the measured circuit is comparatively stable and within the allowable range of the auxiliary power supply, the voltage can be supplied from the measured circuit (VT secondary side). However, if the voltage of a generator is supplied from the measured circuit, the transducer output may fluctuate when the voltage during operation such as starting or stopping of the generator falls below the rated value.
- •Ground the shield line of a shielded cable on the receiving side.

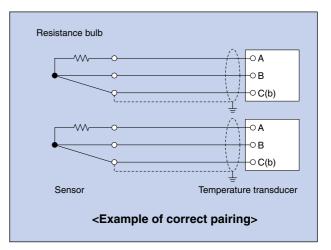

However, depending on the circumstances of external noise, it may be better to ground it on the transducer side.

• Connecting the input line

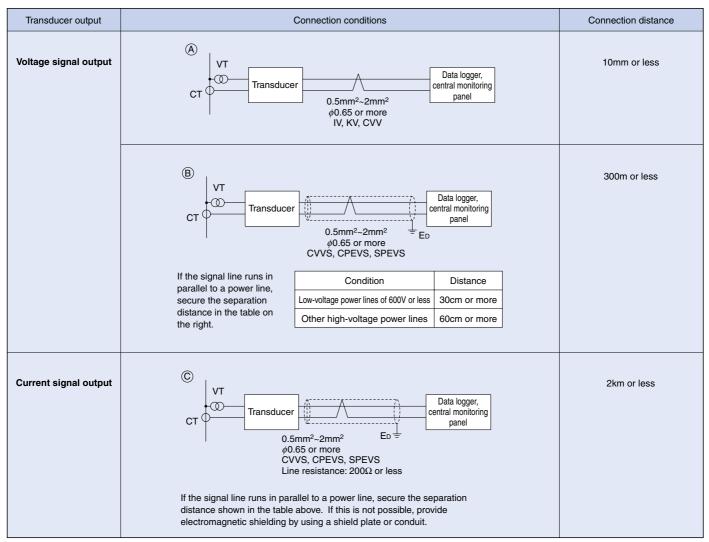

For temperature transducers, isolators, DC level transducers or other transducers that handle minute input signals, arrangements must be made to prevent interference such as noise and surge in the input line. For input lines such as these, in order to prevent incorrect operation and failure due to transmission or noise interference, please use shielded or twisted cables. Additionally, avoid installation alongside power lines or other noise sources as well as pairing different input lines with each other and other lines as shown below.

Signal line connection distance

The connection distance depends on conditions such as the output signal line specifications of the transducer, signal line installation method, external magnetic field and electric field, and cannot be determined unconditionally. However, empirically speaking, the lengths shown below should be used as a reference.

Applicable crimp terminals and tightening torques

Series	Applicable crimp terminals	Tightening torque
T-51, T-101	Round crimp terminals (outer diameter: ϕ 8.5 or less) for M4 screws	0.98~1.47N•m

T-51/T-101 Series

Short-circuiting and opening of output terminals

Handling

- •Terminals for current output Although the terminals may be opened/short-circuited, a voltage of 8~50V is generated when they are opened.
- •Terminals for voltage output Although the terminals may be opened, do not short-circuit them.

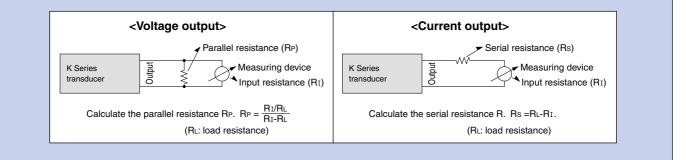

Checking output

Release the load and measure with a voltmeter or ammeter using an input resistance within the specified load range (except the K Series).

K Series transducer

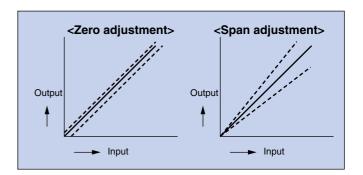

Measure with a voltmeter or ammeter using the same input resistance as the specified load resistance.

If such an indicator is not available, check using the following method.

Output adjustment

- Although the transducer output is adjusted according to the predetermined specifications, use the span adjuster or zero adjuster on the transducer surface to perform readjustment for matching.
 Ordinarily, do not touch these except in special cases.
- With the T-51 and T-101 series, output adjustment is performed upon removing the cap. For dust prevention, put the cap back on after adjustment.
- Adjustment method
 - ① With the span adjuster and zero adjuster, the output increases when turned clockwise and decreases when turned counterclockwise.
 - ②With the zero adjuster, the output range is increased or decreased by a fixed value (approximately ±0.3~±5% with respect to the span) as shown in the figure on the right.
 - ③ With the span adjuster, the output increases or decreases at the same proportion (±3%~±15% with respect to the rated output) with zero input as the base point.

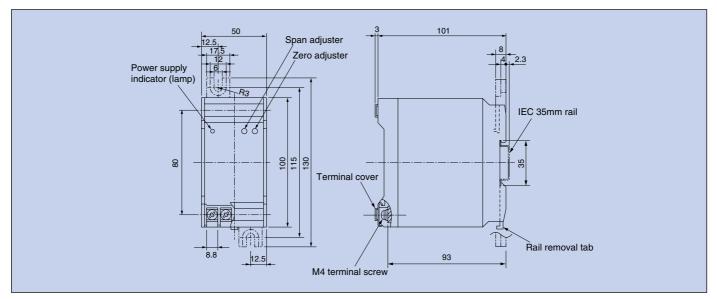

• Standard adjustment procedure

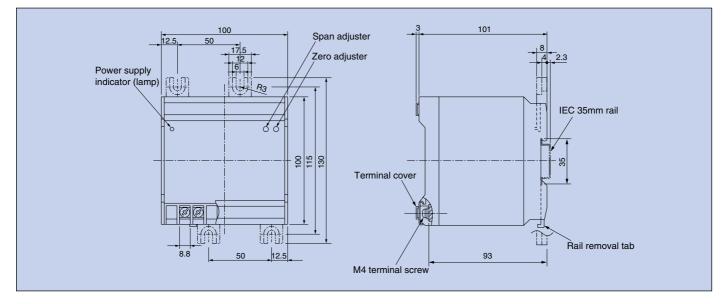

Apply the auxiliary power supply and perform zero adjustment so that the predefined output is output in a state where an input is not applied. Then, apply the rated input and perform span adjustment so that the rated output is output. However, zero adjustment of a frequency transducer is performed with the lower-limit frequency being input, and span adjustment is performed with the upper-limit frequency being input.

Do not apply an excessive force to the adjusters.

●Fig. 1 T-51 Series

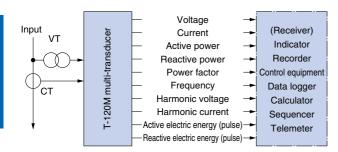

•Fig. 2 T-101 Series

With multi-transducers, the required AC electric quantities can be measured by inputting the secondary sides of a VT and CT.

Measurement elements

- Analog outputs
 - AC voltage, AC current, active power, reactive power Power factor, Frequency
 - Harmonic voltage, harmonic current
- Pulse outputs
- Active electric energy, reactive electric energy
- Block diagram

Features

- •Various elements can be measured with one unit.
- •A liquid-crystal display and buttons enable setting flexibility.
- •Supports power flow measurement (sending, receiving) and can be used for monitoring power generating equipment. (Active power, reactive power, power factor, active electric energy, reactive electric energy)
- •Compact size realizes reducted mounting space.

Analog output patterns

		Measurement element											
Phase-wire system	Analog output pattern		Analog output										output
oyotom		CH1	CH2	CH3	CH4	CH5	CH6	CH7	CH8	CH9	CH10	CH11	CH12

Special Application Transducers

T-120HA harmonics transducers [Insulated]

Applications

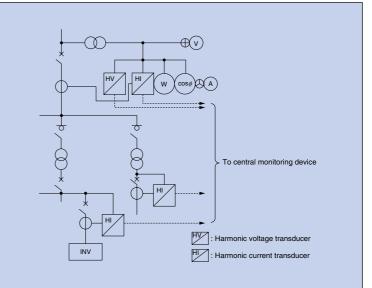

Harmonics transducers perform constant monitoring of the harmonic voltage and harmonic current of a power system, and help to prevent disorder due to harmonics in advance.

Features

- •Various harmonics measurement elements (10 elements) can be measured with one unit.
- •The harmonic voltage and current can be measured with one unit.
- •The harmonic voltage (current) effective value and content (%) can be measured (*).
- •The instantaneous value and average value can be measured. (Switching)
- *: Output selected by setting

Outer dimensions, and names and functions of respective parts

Connection diagrams

• Ground the shield line of a shielded cable on the receiving side

However, depending on the circumstances of external noise, it may be better to ground it on the transducer side. •NC is a connection-forbidden terminal.

Ordering method

Model name		Output	Number of units
Wouer name	Volt	tage or current	Number of units
T-120HA		4~20mA	5

Special Application Transducers

Active power/active energy transducers [Insulated]

Applications

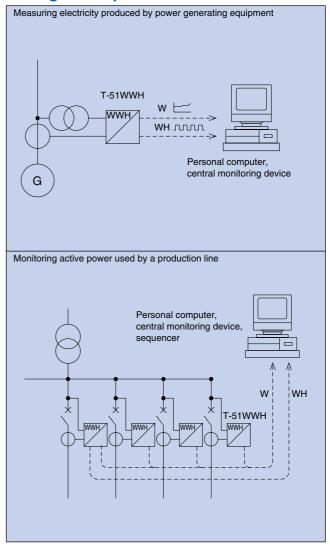

Needs for measuring power and electric energy in various power generating equipment and factory production lines, monitoring operating conditions of power generating equipment, ascertaining generated active electric energy, and performing energy-specific unit management of factory production lines are increasing in recent years.

Needs for detailed monitoring of electricity usage quantities according to respective divisions for carrying out factory energysaving measures and ascertaining the results of energy-saving measures are also increasing.

The Mitsubishi Electric T-51WWH transducer can be used for such applications.

Usage examples

Features

Compact and lightweight

- The outer dimensions are 50(W)×100(H)×118mm(D).
- Weights only 0.5kg.
- Does not take up mounting space.

•Dual output of active power and active electric energy

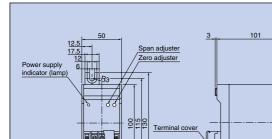

- Can measure the active power and active electric energy of a circuit and deliver two outputs with one unit. A signal of 4~20mA DC is output for active power and a pulse signal is output for active electric energy.
- Less expensive, more compact and more space-saving than a watthour meter and active power transducer combination.

Item	Specif	ication				
Model name	T-51\	wwн				
Measurement element	Power	Electric energy				
Input range	0~1000W (for 110V 5A input)					
input range	0~2000W (for 220V 5A input)					
Phase-wire system	3-phase, 3-wire system or 1-phase, 3-wir	e system (Please specify when ordering)				
Ratings	110V 5A 50-60Hz or 220V 5A 50-6	0Hz (Please specify when ordering)				
Output	4~20mA DC (analog output) Load resistance: 0~525Ω	 Pulse unit: □kWh/P (primary side) Pulse output Output form : open collector Output current : loL 30mA max Withstand voltage between collector and emitter : VCE 35V max Pulse width : 100~150ms Leakage current : 100µA or less (VCE=35V) Measure only in positive direction 				
Accuracy	0.5	(Normal)				
Auxiliary power supply	Unnecessary (supplied from input	voltage between P1~P3, load: 5VA)				
Weight	0.5	0.5kg				
Consumption VA	Current circuit I1 0.1VA I3 0.1VA	Voltage circuit P1-P2 2.5VA P2-P3 2.5VA				

Manufacturable range

(1) Secondary side (available) power value

lagut	Secondary side power value (available power value)						
Input	Standard specifications	Manufacturable range					
110V 5A	0-1000W (standard specification)	VT, CT secondary-side power value: 500~1200W					
220V 5A	0-2000W (standard specification)	VT, CT secondary-side power value: 1000~2400W					

*VT, CT secondary side power value= <u>primary-side power value (W)</u> VCT ratio

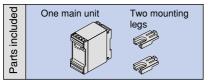

(2) Pulse unit Specify from among three of pulse units according to the full-load active power

Full-load active power (kw)	1~less than 10kW	10~less than 100kW	100~less than 1000kW	1000~less than 10000kW	10000~less than 100000kW
Pulse unit (specify)	0.001kWh/P 0.01kWh/P 0.1kWh/P	0.01kWh/P 0.1kWh/P 1kWh/P	0.1kWh/P 1kWh/P 10kWh/P	1kWh/P 10kWh/P 100kWh/P	10kWh/P 100kWh/P 1000kWh/P

Example: 3-phase, 3-wire 200V 100/5A circuit

Full-load active power = $\frac{\sqrt{3} \times 200 \times 100}{1000}$ =34.6kW Based on the above table, specify from among 0.01kWh/P, 0.1kWh/P and 1kWh/P.

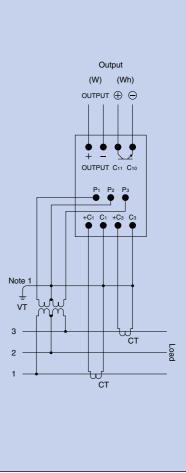

Accessories

Ordering method

Model name]	Phase-wire		VT ratio		CT ratio		Primary side power value		Output		Output pulse unit		Number of units
T-51WWH		3P3W		440/110V		750/5A		0~600kW		4~20mA DC		1kWh/P		3
	For △-Y connection, please specify as such.													

Connection diagram

Note 1. For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

Usage

- Install transducers in panels and use them as interface equipment for inputting DC signals corresponding to items measured into various devices such as central monitor panels, data loggers and measuring equipment.
- •Transducers do not have any particular items requiring operation.

Care

During periodic maintenance that accompanies power interruption, use a soft cloth to wipe off the dust and debris that collects on the surface of the transducer.

In the case of severe soiling, dip a cloth in a neutral detergent diluted with water, wring well, and then wipe the transducer surface. Do not wipe using a chemically-treated dust cloth or cleanser such as benzene or thinner, otherwise discoloration or deformation of the surface may occur.

Storage

Store transducers according to the following procedures. Removal work is to be performed by a person with proper technological expertise in electric works.

1 Removing a transducer

- •Turn off the power to the circuits (input, auxiliary power) connected to the transducer. Confirm that no voltage is applied.
- •Use a screwdriver to loosen and remove the terminal screws of the transducer.
- •Perform the "Method for mounting" procedure on p.151 in reverse to remove the transducer.

2 Storage

For storage, refer to section 8 on p.109.

Request for maintenance and inspection

Perform maintenance and inspection as below to ensure continued use of transducers. (Inspection while power is interrupted must be performed either every six months or every year.)

1 Daily inspection

- •Are there any broken parts in the outer peripheral portion?
- Are there any abnormal noises or odors?
- •Have debris, dust or water drops accumulated?
- •For the T-51 and T-101 series, is the power-on indicator lamp lit?
- •For the T-120 series, is there any abnormality in the LCD screen?
- Is there any indication, record or alarm related to abnormal measurement data in central monitor, data logger or measurement equipment, that receives transducer output signals?

2 Periodic inspection

Inspect the following in addition to the above.

- Is there any abnormality in the output of the transducer? (Check during inspection of receiving/transforming equipment or plant.)
- •Are any of the terminal screws loose? (Before performing this check, ensure that equipment is in the power interrupted state.)

• Is there any overheating or deformation due to stress to various components such as the terminals or outer casing?

Refer to "Checking output" on p.155 concerning inspection procedures.

*2 For T-51LG, the % with respect to basal value that is the maximum value of the mutual difference between output values when the frequency is changed from 40 to 2kHz.

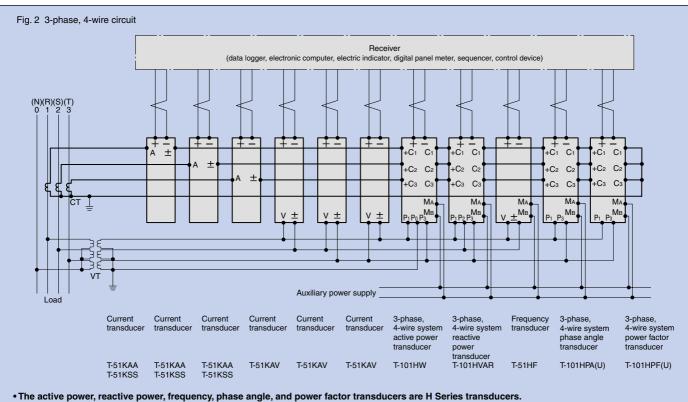

For T-51LGF, the % with respect to basal value that is the maximum value of the mutual difference between output values when the frequency is changed from 45 to 60Hz.

•Fixed-load output (K Series)

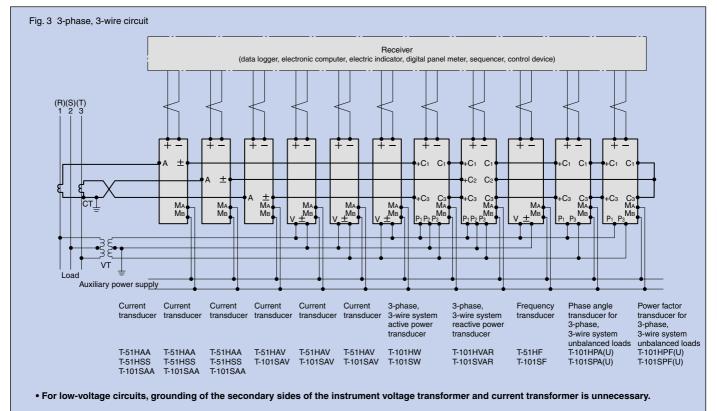

• The active power, reactive power, frequency, phase angle, and power factor transducers are H Series transducers.

• For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

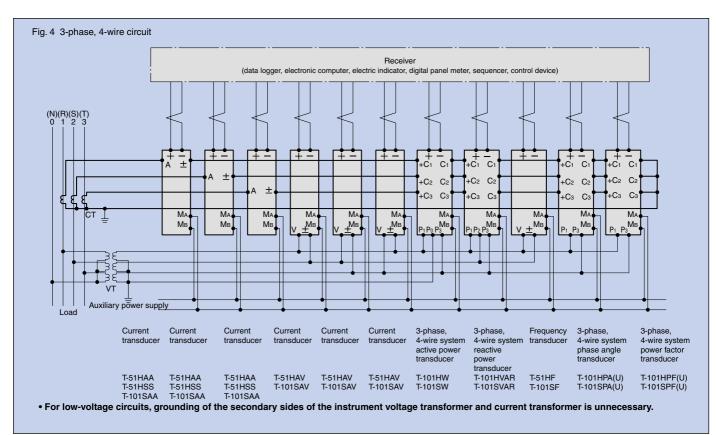

• For low-voltage circuits, grounding of the secondary sides of the instrument voltage transformer and current transformer is unnecessary.

Constant-current/Constant-voltage output (H Series, S Series)

If the auxiliary power supply is DC, connect the \oplus side to "MA" and the \bigcirc side to "MB".

If the auxiliary power supply is DC, connect the \oplus side to "MA" and the \bigcirc side to "MB".

Fixed-load output

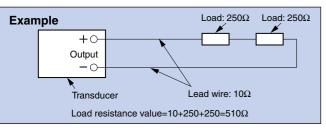

An output system that can be used only with the load resistance value connected to the output being a single, predetermined value and with which an error occurs if the load resistance value differs from the specified value.

Constant-voltage output/Constant-current output

An output system that can be used if the load resistance value connected to the output is within a predefined range, and is suited for cases where the load resistance value is unspecified and cases where future load increase is predicted.

Load

The full load resistance value connected to the output terminals of a transducer.

Output span

The difference between the upper-limit value and lowerlimit value of an effective output range.

Example 1: For an output of 5V, the span is 5V.

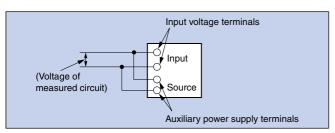

Example 2: For an output of 4~20mA, the span is 16mA.

Example 3: For an output of -5~0~5V, the span refers respectively to the + side span of +5V and the – side span of -5V.

•Auxiliary power supply (control power supply)

An AC power supply or DC power supply necessary for operation of the transducer and supplied from the exterior (i.e., not supplied from the measured circuit). If the voltage of the measured circuit is comparatively stable, it can be used for connection to the auxiliary power-supply terminals.

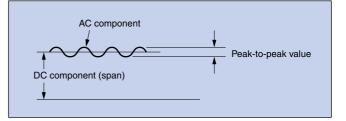

Accuracy (grade)

A term expressing the accuracy of a transducer classified according to the tolerance and limits of influence (influence of temperature, influence of frequency and other allowable limits of performance).

Example: The tolerance of a grade 0.5 transducer is within $\pm 0.5\%$. The tolerance for an input of 1000W and output of 5V is: $5V\times(\pm 0.5\%)=\pm 25mV$.

Output ripple (P-P)

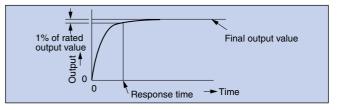

An AC component contained in the output expressed by a ratio of the peak-to-peak value of the AC component and the span.

Response time

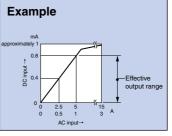

The time it takes for the output to settle within a specified range of a final stationary value when the input changes suddenly from one fixed value to another.

Ordinarily refers to the time it takes for the output to settle within $\pm 1\%$ of the rated output value centered at a final output value when a step input that gives rise to an output change of from 0% to approximately 90% of the effective output range or from 100% to approximately 10% of the effective output range is applied.

•Effective output range

A range within the output range in which predefined performance is guaranteed.

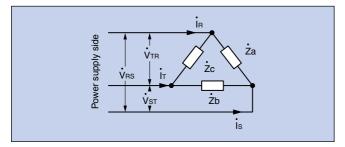

The diagram to the left is an input-output characteristics diagram for T-51KSS and T-51HSS. The effective output range is 0~0.8mA (the output range of 0.8~1mA is not an effective output range).

Saturation output

Although the output in the range 0~0.8mA is proportional to the input in the diagram above, the proportion of change of output gradually decreases and saturates with respect to the proportion of change of input in the 0.8~1mA region. Such an output is called "saturation output".

3-phase balanced circuit

When loads $\dot{Z}a$, $\dot{Z}b$ and $\dot{Z}c$ that are connected to a 3phase power supply are all equal, the respective voltages \dot{V}_{RS} , \dot{V}_{ST} and \dot{V}_{TR} are all equal in magnitude and phase difference among the respective voltages. The respective line currents \dot{I}_{R} , \dot{I}_{S} and \dot{I}_{T} are also all equal in magnitude and phase difference. Such a circuit is called a 3-phase balanced circuit.

Orbital and a second second

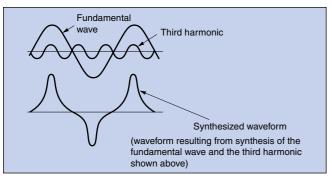

When loads $\dot{Z}a$, $\dot{Z}b$ and $\dot{Z}c$ that are connected to a 3phase power supply are not equal, the respective line currents \dot{I}_R , \dot{I}_S and \dot{I}_T are also not equal in magnitude and phase difference among the respective currents. Such loads are called 3-phase unbalanced loads.

Among phase angle transducers, there are those that can be used with 3-phase unbalanced loads (for 3-phase unbalanced loads) and those that cannot be used with 3phase unbalanced loads (for 3-phase balanced circuit).

Third harmonic

A voltage or a current with frequency that is 3 times that of the fundamental frequency voltage or current (fundamental wave: a 60Hz AC voltage or current in the case of an input frequency of 60Hz).

When a third harmonic or other harmonic is contained, the waveform becomes distorted and becomes a cause of measurement error.

Burnout

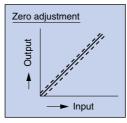

A term often used with temperature transducers and refers to a function by which, when an input line into the temperature transducer or a temperature sensor beyond the input line, becomes disconnected, the output is rises above the effective output range (normally, the output is increased ... positive burnout).

Cold junction compensator

A thermocouple sensor's electromotive force is input to a thermocouple temperature transducer. The voltage corresponds to a temperature less than T°C, the temperature measured at the point only affected by the ambient temperature, Ta°C, thereby compensating for the Ta°C part. This action is performed by a cold junction compensator, which is either attached externally to the transducer or built-in.

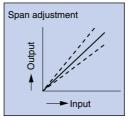

Zero adjuster

With a zero adjuster, the output range is increased or decreased by a fixed value (approximately $\pm 0.3 \sim \pm 5\%$ with respect to the span) as shown in the figure below.

Span adjuster

With a span adjuster, the output increases or decreases at the same proportion $(\pm 3\% \sim \pm 15\%)$ with respect to the rated output) with zero input as the base point.

Mitsubishi Electric Indicators and Transducers

for a greener tomorrow

Eco Changes is the Mitsubishi Electric Group's environmental statement, and expresses the Group's stance on environmental management. Through a wide range of businesses, we are helping contribute to the realization of a sustainable society.
