五、電容器裝置容量 Installed capacities

(1) 計算係數表 Calculation table of coefficients

應用例：

$$\text{改善係數}(K) = \tan(\cos^{-1} \theta_1) - \tan(\cos^{-1} \theta_2)$$

設工廠負荷：1000kW

改善前功因： $\cos \theta_1 = 0.8$

擬改善功因： $\cos \theta_2 = 0.95$

所需電容量 = $1000 \times 0.421 \approx 421\text{kVAr}$ (由下表查得)

Example:

System load of the plant: 1000kW

Power factor before improvement: $\cos \theta_1 = 0.8$

Desired power factor after improvement: $\cos \theta_2 = 0.95$

Capacitance of the capacitor required = $1000 \times 0.421 \approx 421\text{kVAr}$

(Note: 0.421 is obtained from the aforesaid table)

Calculation coefficients of the capacitances after increasing the voltages.

(A) 高壓電容器 High voltage capacitor

(B) 低壓電容器 Low voltage capacitor

系統電壓 System Voltage (V)	電容器擬提升後之額定電壓 (V) Desired rated voltage for the capacitor (V)		
	280	480	600
220	1.620	—	—
380	—	1.596	—
440	—	—	1.860
460	—	—	1.701
480	—	—	1.563

應用例：

設系統電壓380V，所需電容器容量為50kVAr，因考量串聯電抗器時及高諧波含量所造成的壓升，電容器額定電壓擬提高至480V時之容量換算式：

所需電容器容量 = $50\text{kVAr} \times 1.596$ (由上表查得) = 80kVAr (取5的倍數容量)

Example:

Assuming the system voltage is 380V, the required capacitance is 50kVAr. Taking into consideration of voltage rise due to series reactor or high harmonics, the actual capacitance would be:

Required capacitor capacitance = $50\text{kVAr} \times 1.596$ (obtained from above table) = 80kVAr

換算式 Conversion formula:

$$\frac{Q_{\text{原設計}}}{Q_{\text{提升後}}} = \left(\frac{V_{\text{原設計}}}{V_{\text{提升後}}} \right)^2 \rightarrow Q_{\text{提升後}} = Q_{\text{原設計}} \times \left(\frac{V_{\text{提升後}}}{V_{\text{原設計}}} \right)^2$$

$$\rightarrow Q_{@480V} = 50 \times \left(\frac{480}{380} \right)^2 = 80 \text{ kVAr}$$

$$\frac{Q_{\text{original}}}{Q_{\text{desired}}} = \left(\frac{V_{\text{original}}}{V_{\text{desired}}} \right)^2 \rightarrow Q_{\text{desired}} = Q_{\text{original}} \times \left(\frac{V_{\text{desired}}}{V_{\text{original}}} \right)^2$$

$$\rightarrow Q_{@480V} = 50 \times \left(\frac{480}{380} \right)^2 = 80 \text{ kVAr}$$

六、一般保養維護 Maintenance

(1) 低壓進相電容器一般檢查判斷

Low Voltage Power Capacitors General Inspection And Gauge

外觀失效判定

Break down check by visual inspection

屋內型：電容器外部如有上蓋彈出或內部有污漬物噴出等。

Indoor type : If the Capacitor case is left or exposed with some smudges, then it means the capacitor is broken.

基本性能檢查

Basic function inspection

首先被測電容器一定得與電源切離3分鐘以上，再逐以對相對地及相對相實施放電。

First of all, the capacitor must be switched off at least 3 minutes in advance to discharge each phase and phase to ground.

容量的判定（以直讀式容量計測量）

Gauge of capacitance is measured by direct reading capacitor meter

1.由銘牌標示或檢驗合格證上之額定容量除2即等於相間容量。

Half the rated capacitance printed on name plate or certificate is equal to the phase to phase capacitance.

2.相別分辨：一般以銘牌側算起，分別為U相、V相、W相。

Identify phase: The sequence of U、V、W is from the name plate side.

3.測得值換算為額定容量

The rated capacitance calculated by measurement value

$$U-V=a (\mu F)$$

$$U-W=b (\mu F) \therefore (a+b+c) \times 2 \div 3 = \text{額定容量}$$

$$V-W=c (\mu F)$$

$$U-V = a (\mu F)$$

$$U-W=b (\mu F) \therefore (a+b+c) \times 2 \div 3 = \text{rated capacitance}$$

$$V-W=c (\mu F)$$

4.以額定容量為判定基準

Determination by the rated capacitance

- 額定容量的-5%～+15%之內。

Tolerance of capacitance: -5%～+15%

- 多台並聯時先求單台額定容量再乘以台數即可。

When many capacitors are connected in parallel, to know the total capacitance requires to find the individual capacitance first, then times to the total amount afterward.

- 相間不平衡率為108%以內。

二相值取最低者為基準，與其它2相個別相除求百分比即可。

Inter phase unbalanced factor is < 108%.

To adopt the lowest phase as standard level among these three phases, and then to divide another two phases to get the ratio.

(2) 低壓電容器之保養與維護

Low Voltage Capacitor's Maintenance

日常保養

Daily maintenance

1. 電容器適用於周圍溫度45°C以下，初裝時期周圍溫度之平穩與否，通風設備之良否或熱源之幅射及周圍溫度之上升情況均應加以注意。

The capacitor's ambient temperature must be lower than 45°C, whether the ambient temperature is stable during first period or not, and whether the ventilation is good or not. All of these must be paid attention to.

2. 電容器各種保護設備所使用之開關接觸情形，應注意是否有開關接觸不良之情形。

There are many switches with various kinds of protection facilities, attention must be paid regarding to whether the contact point is working properly or not.

3. 檢視所使用之電壓及電流是否正常，若過電壓使用將使得電容器容量增大，溫度上升，除危及電容器壽命外，也常因異常電壓而造成內部組件絕緣被破壞。

Voltage and current are normal or not must be checked. The results of over voltage could be:

- enlarging capacitance
- temperature rising
- shortening life time of capacitor
- destroying the internal components by abnormal voltage

4. 察看電容器端子及導線間是否有因接觸不良而引起異常之現象。

Check the terminals of capacitor and among connection wires to see whether have arc caused by disconnection or abnormal phenomena or not.

5. 察看有否其他不正常現象。

Check for other abnormal phenomena.

定期維護

Maintenance by time

1. 電容器經過長時間使用套管表面將有灰塵堆積，若一吸濕，即產生絕緣不良導致漏電嚴重，使保護設備跳脫，電容器需在切離電源後3分鐘以上，並經地線放電後，方可清除套管上之灰塵，以免觸電。

After using capacitor for a long time, dusts on bushing must be cleaned because dust will be accumulated. Dusts mixed with moisture will reduce the insulation resistance which might cause serious leadage. The protection apparatus will act when it comes seriously. After switching off the power for at least 3 minutes, and had better to discharge through grounding in order to avoid electric shock, then the cleaning can be done.

2. 應定期擦拭表面之灰塵，以免表面溫度不易揮發。

All of the capacitors must be cleaned and polished from time to time to help to release heat.
